Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 00. Introduction

One of the oldest fields in human development is civil engineering. Civil engineering is practically as old as human civilization and it is one of the most significant industrial branches. It includes a wide field of designing and building diverse systems and structures: bridges, residential buildings, public facilities, roads, airports, railways, tunnels, underground facilities, water supply facilities, water flow regulations, designing and planning settlements, etc. Civil engineers in industry and in society have always found their place since civil engineering represents one of the main stimuli in industrial development. Since Serbia is becoming the area for significant developmental infrastructure projects, from building all types of traffic roads via intensive urbanisation and residential building to major projects in the function of sustainable development and environmental protection, it is realistic to expect that the demand for civil engineering experts will continue and probably increase in the period to come.

Hence, civil engineering in educational sense should be regarded as a study programme which provides an objective response to presented demands from practice. The programme should enable students to adequately understand the basic principles in diverse areas of technology, to gain necessary theoretical knowledge, as well as to master concrete professional knowledge for successful performance in engineering jobs in the field of construction, hydrotechnics and roads.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 01. Programme Structure

The name of the study programme of these undergraduate academic studies is Civil Engineering. The academic title awarded is Bachelor in Civil Engineering (BSc. (Civ.Eng.)). The outcome of the study process is the knowledge that enables students to use professional literature, to apply that knowledge in solving problems occurring in profession, and, in the case of students' wishes, to enable them to continue their studies.

The prerequisites for enrolling the study programme are the completed four-year-long secondary school and passed qualification examination. The qualification examination consists of maths examination (graded with the maximum of 60 points) and it is considered to be passed if the candidate has the minimum 14 points.

The undergraduate academic studies in Civil Engineering last for four years. First three years are mutual for everyone, and on completing the third year, following their own competences and wishes, students decide to enrol one of the three study groups (Structures, Hydrotechnics, and Roads). Within the study group "Structures", the emphasis is placed on designing and building I concrete, steel and wood structures. Within the study group "Hydrotechnics", students are enabled to use the basic principles for designing hydrotechnical systems in the fields of water supply, sewerage, melioration, etc. Within the study group "Roads" students acquire basic knowledge in road planning. Within the selected study group, students have obligatory and elective courses. Elective courses are selected from the groups of proposed courses. Teaching is performed in lecturing and practice. At lectures, with the usage of adequate didactic means, the course material is presented with necessary explanations contributing to better understanding of course content. At practice that follows the lectures, concrete tasks are solved and examples are presented for additional explanations of the course content. Practice classes also serve to obtain supplementary explanations for the material presented at lectures. Practice can be auditory, laboratory, computer and computing. Students have to have obligatory professional practice, done individually in construction organizations. During the teaching process, professional excursions are organized – visits to characteristic facilities, concrete factories, construction fairs, etc.

Each course has a certain number of ECTS credits, and the entire studies are considered to be completed when the student fulfils their obligations described in the study programme and in the process obtains at least 240 ECTS credits.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 02. Programme Objectives

The aim of the study programme is the education of students for the profession of a civil engineer in accordance to the demands of the society.

The study programme in Civil Engineering is designed is such a manner as to provide the acquisition of competencies that are socially justifiable and useful. The Faculty of Technical Sciences has defined fundamental tasks and aims in educating highly competent professionals in the field of civil engineering. The aim of the study programme in Civil Engineering is completely in accordance with the fundamental tasks and aims of the Faculty of Technical Sciences.

The realization of a designed study programme provides the education for engineers in civil engineering who have competence in European and worldwide frameworks.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 03. Programme Goals

The objective of the study programme is to achieve competencies and academic skills in the field of civil engineering. Among other items, it also includes the development of creative abilities in problem observations and the ability of critical thinking, the development of abilities for teamwork and possessing specific practical skills necessary in the profession.

The objective of the study programme is to educate experts who have enough complex knowledge in the fundamentals in designing and building structures in building construction, Hydrotechnics and road networks.

One of the special objectives, in accordance with the objectives in educating experts at the Faculty of Technical Sciences, is the development of consciousness with students for the need of permanent education, development of the society in general and environmental protection. The objective of the study programme is also the education of experts in the field of teamwork, as well as the development of competencies for presenting their results to the professional and wider public.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

Civil Engineering

Standard 04. Graduates' Competencies

Graduate students in Civil Engineering are competent to solve real problems in construction practise, as well as to continue their education if wanted. The competencies include, first and foremost, the development of the ability of critical thinking, ability to analyse problems, synthesise problems, and predict the behaviour of the selected solution with the clear presentation of advantages and drawbacks of the selected solution.

Graduate students at this level of studies possess competencies for applying their knowledge in practice and for monitoring and applying novelties in their profession. Students are able to design, organize and manage production. During education, a student obtains the ability to individually design and supervise the building of simpler structures.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 05. Curriculum

The curriculum of the undergraduate academic studies in Civil Engineering is formed in a manner to satisfy all set objectives. The structure of the study programme provides approximately 15% of academic general courses, 20% of theoretical and methodological courses, 35% of scientific and professional courses and 30% of professional applicative courses. It also fulfils the requirement that elective courses may obtain 20% of ECTS credits. Apart from this classification, the courses included in these studies can be classified into the following groups:

- group of courses in fundamental disciplines (Mathematics, construction physics, ...);
- group of courses in theoretical mechanics;
- group of courses in structural theory;
- group of courses in construction materials;
- group of courses in structures in construction;
- group of courses in the field of foundation, geotechnics and road networks; and
- group of courses in the field of organization and building technology.

First three years present fundamental, general and common education of all students in this educational programme, and on completing these three years students select one of the three study groups: Structures, Hydrotechnics and Roads. Hence, on the fourth year, students concretize the problems in civil engineering with the problem specifics related to each of the study groups. During the fourth year, there are obligatory and elective courses. Studying the elective courses, students satisfy their affinities profiled in the first three years.

All courses are one-semester long and have an adequate number of ECTS credits, where one credit equals approximately 30 hours of students` activities. The schedule of held classes in the study programme is organized in such a manner so that knowledge necessary for subsequent courses is learnt in the previously held courses.

Curriculum defines the description of each course with name, type, year and semester of studies, number of ECTS credits, teacher's name, course outcome with expected results, knowledge and competencies, prerequisites for course attendance, course content, recommended literature, lecturing methods, knowledge evaluation and other data.

Study programme is in accordance with European standards regarding enrolment conditions, study duration, transfer to another year, diploma acquisition and manner of studies.

A part of the curriculum at Civil Engineering is a professional practice lasting for 45 hours, realized in an adequate construction organizations and public institutions.

Students complete studies by elaborating the final thesis comprising of a theoretical and methodological preparation necessary for deepened understanding of the field in which the final thesis is elaborated, and the elaboration itself.

Before the defence of the thesis, the candidate passes theoretical and methodological fundamentals in front of the tutor. The final grade of the final thesis is based on the grade for the passed theoretical and methodological preparation and the grade for elaborating and defending the thesis. Final thesis is defended in front of the committee comprised of at least three teachers.

Precondition courses	•		None				

1. Educational goal:

Enabling students for abstract thinking and acquiring basic knowledge in the field of mathematical algebra and analysis.

2. Educational outcomes (acquired knowledge):

Student is competent for using acquired knowledge in further education within professional courses, as well as for making, analysing and solving mathematical models.

3. Course content/structure:

The field of real and complex numbers. Determinants and szstems of linear equations. Matrices and matrix calculation. Vector algebra in space . Analytic geometry in space – line, plane. Polynomials and rational functions. Sets. Real functions of one real variable – limit value, continuity, differential calculus and application.

4. Teaching methods:

Lectures. Computing practice. Consultations. In lectures, theoretical content is presented and illustrated with examples. In practice, characteristic tasks are done to deepen the understanding of the presented content. Apart from lectures and practice, individual consultations are held regularly for further explanations of the course content. A part of the content, making a larger logical unit, can be passed in the form of the two parts. First part: Field of real and complex numbers. Determinants and szstems of linear equations. Matrices and matrix calculus. Vector algebra in space. Analytic geometry in space – line, plane. Polynomials and rational functions. Second part: Sets. Real functions of one real variable – limit value, continuity, differential calculus and application.

1. Educational goal:

Developing spatial visualisation abilities, spatial imagination abilities, and ability of solving problems in various mutual spatial relations of three-dimensional (3D) geometric forms on two-dimensional (2D) presentation of parallel projection as a basis for 3D analysis of every 2D presentation.

2. Educational outcomes (acquired knowledge):

Ability to identify and interpret spatial relations of the learnt spatial shapes from appropriate 2D presentations, as well as to know their geometric structures; ability for optimal graphic presentation of learnt 3D configurations via characteristic perspectives and spatial presentations on 2D media.

3. Course content/structure:

FUNDAMENTAL ELEMENTS OF SPATIAL VISUALISATION. Projecting, observation directions and types of images of basic geometrical forms (point, line, plane). Criteria for obtaining characteristic observations and positions on an object (transformation and rotation) with the aim of direct detection of metric characteristics and the recognition of spatial relations of an object. Concepts of visibility. Application on more complex forms (plane figures, polyhedral, solids of revolution, surfaces of constant slopes, roofs).

FUNDAMENTALS OF STRUCTURE VISUALISATION IN DETERMINED PROJECTION. Real terrain, topographic surface, surfaces with constant slopes. Structures with accompanying fills and cuts. Cross sections/profiles in vertical projecting surfaces. Analysis on structure protection from atmospheric water.

4. Teaching methods:

Lectures. Graphic - auditory practice. Tutorials.

Precondition courses	-		None				

1. Educational goal:

Enabling students to relate structural characteristics of construction materials with their properties, obtaining knowledge in the field of examination and application of metals, polymers and plastic masses, as well as of corrosion forms of these materials.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used by students in further education, professional courses and engineering practice

3. Course content/structure:

Atomic and molecular structure of materials (fundamental particles, periodic table). Inter-atomic and inter-molecular connections (connection strength – connection with module of elasticity and extension coefficient, connection energy – primary and secondary connections). Structure of crystals (unit cell, types of unit cells, crystal structure of metals and silicate ceramics, crystallographic directions and planes, polycrystals, non-crystal structures). Errors in crystal grid (dot and line defects). Deformation and strengthening of metals (characteristics of dislocation, concept of plastic deformation explained via dislocation movement, strengthening mechanisms via grain size, creation of solid solutions by deformations). Repair, recrystalisation and growth of grain, deformation mechanisms in ceramics. Dispersive systems and surface appearances. Fundamental properties of construction materials (general and specific properties, condition parameters, physical properties, physical and mechanical properties, construction and technological properties. Thermal technical properties and water vapour diffusion – principles of calculation and definition of structures according to valid regulative. Diffusion. Fundamentals in kinetics of chemical reactions. Condition diagrams. Phase transformations in metals, development of microstructure and correlation with mechanical properties. Production processes, types and application of steel. Steel corrosion. Polymer structure. Deformation mechanisms and strengthening in polymers. Polymer structure. Production and application of polymers. Plastic masses. Types of composite materials (composites – agglomerates, reinforced, structural composites).

4. Teaching methods:

Teaching is held with the aid of contemporary technical methods: Power Point presentations, usage of film and graphic illustrations, programmes for calculating heat and diffusion conductivity of materials. At lectures, content is presented in a manner to directly and unambiguously emphasise properties and sizes necessary in the field of civil engineering with the obligatory connection of the presented property with material structure. Lectures are organized as interactive form of teaching, with predicted conclusion observations and questions that stimulate students for active participation at the end of each class. Practice are organized as expansion and deepening of certain topics using practical work and computing examples.

1. Educational goal:

The aim is for students to acquire necessary knowledge in the filed of geology sciences, which are necessary as a basis for listening others courses in the field of geotechnics. Special emphasis is on the demand for knowledge on soil and rock genesis, homogeneity and anisotropy of individual properties of rocks and soil, as well as the stability of all types of terrain.

2. Educational outcomes (acquired knowledge):

Necessary knowledge being taught will serve for normal attention in classes in the field of geotechnics.

3. Course content/structure:

General assumptions on the origin of Earth, its crust and shallow surface zone in which construction activities take place. Application of mineralogy and petrology as a basis for investigations in the field of geotechnics. Physical-mechanical and technological properties of rocks used as construction materials, being a foundation for structures or a space to build structures in. Tectonic activities, spreading, creasing and cracking of rock masses. Applied hydro-geology. Geological aspects of seismicity of areas and influences of soil types on total seismicity. Endogenous and exogenous geological processes, conditions for their origin and engineering activities for preventing their hazardous influences. Principles and methods of geotechnical terrain examinations for diverse construction facilities.

4. Teaching methods:

Auditory lectures and laboratory practice.

Precondition courses			None							

1. Educational goal:

Obtaining sociological knowledge on the participants in work, forms and structures of work organization, as well as the connections between work organization and society in order to increase the efficiency of human resources and organization management.

2. Educational outcomes (acquired knowledge):

Acquiring knowledge on the significance of work and social factors influencing the value of work, knowledge on theoretical opinions of the work organization and contemporary organization models, knowledge on formal and informal structure of work organization, knowledge on the factors influencing the success of an organization, knowledge on the influence of technology and technological innovations on the development of the society, knowledge on the global changes in contemporary society and change factors.

Course content/structure:

Person and the value of work: work distribution and professionalism, needs, interests and values as stimuli of human work. Theoretical opinions on work organization: scientific management, theory on inter-human relations, theory on bureaucratic organization, situation theory, behaviouristic theory. Contemporary organization models: simple, bureaucracy, multi-divisional, professional, Japanese, Adhocracy. Organization structure: formal horizontal and vertical structure, authority and responsibility in an organization, friendly and interest groups. Factors in the organization development: organization success, influence of national cultures, technology and organizational culture on success. Work motivation: theory on motivation and motivation models, working moral and productivity, human resources. Alienation in work and leisure time: alienation in work, alienation and technology, alienation in leisure. Conflicts in an organization: social, organizational and personal conflicts, syndicates and the power of employees, strikes, industrial sabotage, white collar criminal and corporation criminal. Work humanization: working groups, teamwork, forms of collective negotiation and industrial democracy. Alteration in work in modern times: knowledge economics, employment policy, unemployment, working place insecurity, end of work for lifetime. Global changes and changing factors: class structure of the modern society and movement channels, globalization and economic inequality, influence of technology, culture, politics and economics on the development of the society.

4. Teaching methods:

In lectures, problems are presented, and the discussion is opened where students can ask questions, give remarks and complement the presented course content.

1. Educational goal:

- 1. Ability of engineers to understand the social significance and the role of technology in the development of the society, positive and negative influences of technology on the development of society and humans, as well as their own social significance and responsibility in creating a humane society. 2. Obtaining fundamental knowledge on the economic aspect of earning in construction.
- 2. Educational outcomes (acquired knowledge):
- 1. Obtaining sociological knowledge on properties, sources, social functions and creators of technological knowledge; knowledge on the influence of the nature of social systems on the development of technology and the influence of technology on the development of society; knowledge on the influence of technology on the globalization processes. 2. Enabling civil engineers to monitor social end economic processes and to apply the acquired knowledge in the rational usage of all potentials in the field of civil engineering.
- 3. Course content/structure:
- 1. Technical knowledge: properties of technical knowledge, social functions of technology, sources of technical knowledge, creators of technical knowledge, expansion of technical knowledge, scientific and technical potential, relation of science and technology, technology and ethics, technology and culture, technology and person, technology and freedom, technology and conscience. Relations between technology and society: influence of society on the development of technology development of technology in pre-capitalism, development of technology in capitalism; influence of technology on the development of society gatherers` societies, agricultural societies, industrial society, information society. Technology and globalization: causes and dimensions of globalization, influence of globalization on the lives of people and the culture, globalization and inequality, technological gap, brain drain; technology and economic crisis electrical viruses, global warming, genetically modified food, technical risks, technical society as risk-taking society. 2. Role of construction in the industrial system. Business systems in civil engineering. Means engagement and spending. Determining costs and prices. Economic business principles and achieving business success.

4. Teaching methods:

In lectures, problems are presented, and the discussion is opened where students can ask questions, give remarks and complement the presented course content.

Precondition courses

1. Educational goal:

Enabling students for abstract thinking and acquiring basic knowledge in the field of mathematical algebra and analysis.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used in professional courses. Student is competent for making, analysing and solving mathematical models in the further education within professional courses.

3. Course content/structure:

Real functions of one real variable – indefinite and definite integrals and application. Real functions of several real variables – limit value, indefiniteness, differential calculation and their application. Common differential equations of the first order. Common differential equations of the higher order; linear differential equations of the n-th order with constant coefficients; Euler's differential equation.

4. Teaching methods:

Lectures. Computing practice. Consultations. In lectures, theoretical content is presented and illustrated with examples for better understanding of the course content. In computing practice, tasks are done to deepen the understanding of the presented content. Apart from lectures and practice, individual consultations are held regularly. A part of the content, making a larger logical unit, can be passed during the teaching process in the form of 2 modules. First module: Real function of one real variable – indefinite and definite integrals and application. Second module: Real functions of several real variables – limit value, indefiniteness, differential calculus and application, ordinary differential equations of the first order, linear differential equations of the n-th order with constant coefficients, Euler's differential equation.

Precondition courses

1. Educational goal:

Obtaining knowledge on the procedures for manufacturing, the most important properties, investigation methods and application of the most often used construction materials and materials for special applications.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used by students in other professional courses and on graduating, in the engineering practice. Student is competent to choose and define the required properties of fundamental construction materials during the design, as well as to use and control the quality of these materials during building.

3. Course content/structure:

Manufacturing, most important properties, and application possibilities in construction practice of the following traditional and contemporary materials: Construction stone and aggregates for mortars and concrete; Construction ceramics (wall, roof, and ceramics for covers and paths); Non-organic binding materials (construction lime, construction gypsum, cements); Lime-silicate materials; Mortars (for plastering, for building, and special mortars, mortar content); Concrete – basic notions and concrete products (prefabricates); Wood and wood-based products, faults of wood and timber, timber durability and protection; Construction glass; Materials with special application (hydro insulation materials, thermal insulation materials, paints, lacquers and glues); Technical conditions and quality control for construction materials. Illustration of the application of traditional and contemporary materials for building via the survey of the most common structures in individual historical eras.

4. Teaching methods:

During lectures, presentations with photographs, tables, diagrams, formulas and emphasised text – definitions are used to explain the students the course content predicted by the curriculum. There are also short thematic films. In laboratory practice, students can observe or do by themselves the standard examinations of construction materials. A part of the practice is computing, where students use tasks to connect the presented course content with the construction practice. Professional excursion (construction fair and interesting structures under construction) is obligatory for all students.

Precondition courses			None						

1. Educational goal:

Introduction of basic principles and methods of statical analysis, and their application in the study of equilibrium of mechanical systems

2. Educational outcomes (acquired knowledge):

Students acquire theoretical and working knowledge of equilibrium analysis of mechanical systems. Acquired knowledge serves as a basis for analysis other professional courses and in engineering practice.

3. Course content/structure:

Basic concepts of mechanics: space, time, force, mass. basic models: particle, system of particles, rigid and deformable body. Axiom of inertia – statics of a particle. Basic principles (axioms) of the rigid body statics. System of concurrent forces. Moment of a force about a point, moment of a force about an axis, Varignon's theorem. A couple, reduction of a force to a point. Arbitrary system of forces. Coplanar forces - equilibrium. Equilibrium of the system of rigid bodies. Friction. Analysis of the arbitrary system of forces, static invariants, central axis, Varignon's theorem. Parallel forces. Center of gravity, centroid. Analysis of structures. Trusses - method of joints, method of sections. Beams and frames - axial force, shearing force and bending moment. Cables and catenaries. Analytical statics. Virtual displacement, virtual work of forces and couples. Principle of virtual work. Stability of equilibrium.

4. Teaching methods:

Lectures, exercises, consultations. During the lectures, theoretical background is presented. During the exercise classes, the acquired theoretical knowledge is applied in solution of diverse problems. Partial examinations are organized during the semester. Partial examination in the analysis of structures is obligatory, while other ones can substitute appropriate parts of the written examination.

Precondition courses N

1. Educational goal:

Through processing the specialized texts in the various civil engineering areas, students are introduced to professional terminology in English language for specific purposes. Texts are based on the topics that students are introduced with in other courses, so they expand their English vocabulary with known topics. Professional terminology is adopted, in accordance with definitions, classifications, terms and concepts adopted in contemporary European and world standards. Through the expansion of vocabulary, collocations, prefixes and suffixes the knowledge of the English language is expanded. Also, grammatical and lexical structures, important in profession for special purposes, are adopted.

2. Educational outcomes (acquired knowledge):

Enabling students, at the professional level, to acquire sufficient and adequately knowledge and communication skills in English for communication with clients, colleagues and employers.

3. Course content/structure:

Specialized texts in the following areas: fundamentals in civil engineering, theory of elasticity, fundamentals in mechanics, building structures, materials (cement, concrete, wood, steel), concrete structures, structural elements, loads, bridges and bridge types, precast systems, introduction to highway engineering, introduction to airport engineering, well-known structures in the country, and geodesy.

4. Teaching methods:

Teaching is held using the communication method of language learning. After a short introduction into the certain topic, students read the text and individually find unknown words in the glossary. After that, there is a discussion on the topics mentioned in the text and on conclusions presented by the text. A part of the class is dedicated to adopting and practicing new vocabulary using oral and written exercises, as well as to repeating and expanding knowledge on individual grammatical structures. Students are encouraged to work in groups or all together to discuss as much as possible using the English language.

1. Educational goal:

Further developing the German language essentials, expansion of vocabulary related to various situations, extension in the usage of tenses, adoption of more complex sentence structures, introduction to culture, customs and ways of thinking of people speaking the German language, expansion and developing language communication competence.

2. Educational outcomes (acquired knowledge):

Students are capable of using both oral and written language in a number of everyday situations by using the expanding vocabulary and more complex grammar structures

3. Course content/structure:

Practical part of the course: comprehending complex everyday spoken situations, developing the ability to understand the listened text. Theoretical part of the course: imperfect, part of passive structures, certain infinitive structures, subject and object clauses, conjunctive 2, question pronouns, relative pronouns with relative clauses, asking questions in indirect speech, final sentences with the linking word damit, verb rection, verb use of comparative and superlative, certain time sentences.

4. Teaching methods:

Müller, H. Müller

Emphasis is on communication, implying students' activity during the classes. During the communication, mutual interaction is essential.

Precondition courses			None						

1. Educational goal:

Acquiring basic knowledge in the field of building engineering (building structure, purpose, position, form, dimension and materialisation of all elements), and the elaboration of functional structures.

2. Educational outcomes (acquired knowledge):

Acquired knowledge presents the basis for attending and understanding professional courses dealing with building structure in general and its elements, using the method of calculating the influences, element dimensioning, organization and realization plans.

3. Course content/structure:

Notions and definitions, purpose, position, form, dimension and materialization of a building as basic elements in the methodology on building analysis. Building structure and systematization of its parts. Building division of functional segments, partitions and claddings. Elaboration of the functional parts of a structure. Elements of the functional parts of a structure in foundations. Structural elements in the body of a building; walls, columns, staircases. Roof structure. Building realization procedure using major construction works.

4. Teaching methods:

Teaching process is realized through lectures in the form of presentations and through graphic practice which students do individually during the classes assisted by the assistant. In practice classes, based on obtained information (from lectures and general introduction into practice), students solve the set tasks (graphic practice). Students are familiar with the content of the task, so they can prepare and bring literature which can be used during their work. All completed and positively graded tasks receive a certain number of points. The examination includes the entire course content from this semester and it is taken in written form. The examination grade is formed on the basis of lecture and practice attendance, points from graphic practice and written part of the examination.

1. Educational goal:

Developing intelligence abstract concepts of mechanics and mechanical relationships and knowledge of the mechanics as one of the main areas in engineering education.

2. Educational outcomes (acquired knowledge):

Students use the acquired knowledge in their future education and in their practice after graduation from college.

3. Course content/structure:

Number of degrees of freedom. Position vector of the point. Middle and current velocity and acceleration points. Speed and acceleration points in the Cartesian coordinate system and the natural coordinate system. The radius of curvature paths. Distance traveled spots. Kinematics translatory movement of the body, rotation about a fixed axis and plane of movement. The principle of specificity. Newtons laws of dynamics. Types of force. Tasks dynamics. Differential equations of motion of a material point in the Cartesian coordinate system and natural. Free and forced vibrations of a material point. Momentum, work force and potential energy. General laws of particle dynamics. The theory of particle strikes on the stationary wall. Dynamics of a system of particles. The center of mass. The general laws of dynamics of the system. Internal work force rigid body. Working torque point and the team. Dynamics of translatory motion of a rigid body. The moment of inertia. Steiners theorem. Dynamics of rotation of a rigid body about a fixed axis. Physical pendulum. The dynamics of the plane motion of a rigid body.

4. Teaching methods:

Lectures. Auditory exercises. Consultation. Continuous monitoring of the level of students knowledge through two homework assignments, two tests (mandatory) and a colloquium (optional). Examination.

Course id:	GG15]	St	rength of Materials					
Number of ECTS:	8								
Teacher:		Novakov	Novaković N. Branislava						
Course status: Mandatory									
Number of active tea	ching classe	es (weekly	')						
Lectures:	Practical classes:		Other teaching types:	Study research work:	Other classes:				
4 4		0		0	0				
Precondition courses			None						

1. Educational goal:

The objective of the course is enabling students to analyse stresses and deformations occurring in structural elements, as well as to solve statically determinate and indeterminate problems. Dimensioning of structural elements.

2. Educational outcomes (acquired knowledge):

The acquired knowledge enables students to recognize and analyse stress conditions and deformations for elastic bodies on whose basis they can perform the dimensioning of elements. Students are capable to individually solve problems in the field of strength of materials.

3. Course content/structure:

Stress analysis. Stress tensor. Main stresses. Extreme values of tangential stresses. Deformation analysis. Deformation tensor. Hook's law. Planar stress condition and planar deformation condition. Conditions for compatibility. Hypotheses on strength of materials. Geometric characteristics of flat cross sections. Main momentums of inertia. Axially loaded pole. Statically indeterminate tasks in axially loaded poles. Torsion. Statically indeterminate tasks in torsion. Girder bending. Inclined bending and eccentric pressure. Cross section core. Statically indeterminate beams. Deformation work method. Betty-Maxwell's theorems. Castigliano's theorems. Maxwell-Moore's method. Verescagin's method. Solving statically indeterminate systems. Euler's method for stability analysis. Critical bending limits for some characteristic cases. Limitations for Euler's patterns. Tetmajer's method. Impact load. Hypothesis on failure.

4. Teaching methods:

Lectures. Auditory practice. Consultations. In lectures, the theoretical part of the course content is presented and complemented by characteristic examples. In practice, additional tasks are completed to broaden the lecture content. Regularly, in previously determined terms, consultations are held every week. Course content is divided into three modules: first module (stress, deformation, axially loaded pole) and second module (torsion, bending) and third module (buckling, deformation work) which can all be passed separately. If one does not take modules to pass, they can take written examination which is eliminatory. On passing the modules or written examination, students have to pass the oral examination. Oral examination is obligatory.

1. Educational goal:

Acquiring basic concepts and skills necessary for active participation in theoretical and professional advanced courses.

2. Educational outcomes (acquired knowledge):

Acquired knowledge have direct application in theoretical engineering subjects, in formulating and solving engineering of problems.

3. Course content/structure:

Introduction to the civil engineering industry, a brief history. Classification into subdisciplines. Profession and ethics of a civil engineer. Elements and assemblies of bearing and nonbearing structures. Types and methods of foundation. Combinations of materials and systems. Installations. Structural systems for buildings and engineering structures. Construction methods. The basic types and elements of hydraulic structures. Fundamentals of roads and traffic facilities. The process of design and construction of buildings and facilities. Regulations, rules and standards for the design. Planning and construction low - basic concepts. Mandatory content of the design project. Urban-technical conditions. Technical documentation - description and content. Permits and licenses. Sustainable development, environmental impact and energy efficiency of buildings. Management of civil engineering structures. Maintenance. Achievements in world and Serbian civil engineering.

4. Teaching methods:

The course is conducted through lectures, exercises and tutorials, as well as periodic visits to the construction sites and built structures.

Precondition courses			None							

1. Educational goal:

Enabling students in fundamental areas to obtain professional knowledge and application in practice.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used as a base for further upgrades in professional courses.

3. Course content/structure:

Fundamentals in hydrology and hydrometrics. Physical and chemical properties of fluids. Hydrostatics, piezzometer, manometer, absolute, atmospheric and hydrostatic pressure. Pressure forces onto flat and complex surfaces, fluid pressure onto pipe and reservoir walls. Hydro-kinematics, fluid velocity, flow, continuity equation, constant flow equation for ideal and real fluids. Application of Bernoulli's equation in concrete examples. Flow in pipelines, line and local losses of mechanical energy. Constant flow in conductors with open channels. Uniform flow with open channels, Chezy and Manning's equation, flow regimes "steady", "turbulent" and "critical". Non-uniform flow with open channels, transition regimes. Short structures, overflows, outflow and flow around bridge piers. Basic postulates in ground water flow, under pressure with open channels, Darcy's groundwater flow equation.

4. Teaching methods:

Teaching is held interactively in the form of lectures. In lectures, theoretical part of the course content is presented and accompanied by characteristic examples for better understanding of the course content. Apart from lectures, consultations are held regularly. Student can find lecture presentations in the electronic form as well. Part of the course content, making a logical segment, can be taken during the teaching process in the form of partial examination. Partial examinations are taken in written form, as tests.

Enabling students to calculate and analyse all types of statically determinate line girders applied in construction. Acquired knowledge can be used in professional courses and in professional practice.

3. Course content/structure:

Technical theory on rod bending in a plane. Geometry on rod deformation and force geometry. Basic unknowns and basic equations, static and mathematical classification of girders. Theorems on girder energy. Principles of virtual motion, principle of virtual forces and their application. Influential functions, influential lines and their application. Statically determinate girders: determining the support reaction and forces in cross sections of solid and trussed girders; knot method, decomposition method, element replacement method, application of virtual motion principle. Construction of influential lines: static method, kinematical method, element replacement method. Deformation of statically determinate girders. Determining particle movement and cross section torsion; geometric solution, application of virtual forces principle. Statically kinematical analogy, determining movement diagrams for solid and trussed girders. Theorems on mutual actions. Construction of influential lines for deformation sizes.

4. Teaching methods:

Lectures, numerical – graphic practice, consultations. Practice are held in groups, and processed tasks fully follow the lecture content. Condition for taking the exam is positively evaluated individual tasks, as well as required success at the two theoretical partial examinations.

1. Educational goal:

Enabling students to apply principles and methods for calculating and dimensioning reinforced concrete cross sections and elements.

2. Educational outcomes (acquired knowledge):

Knowledge and application of principles and methods for calculating and dimensioning reinforced concrete cross sections and elements. Necessary fundamentals for other professional courses in the field.

3. Course content/structure:

Review and development of concrete and reinforced concrete structures and technical regulations. Concrete and reinforcement, joint work (physical properties, sectional distribution of reinforcement, shaping the reinforcement, anchorage and continuation of reinforcement, local stresses). Ultimate states. Ultimate limit states: methods to determine the effects (linear theory, linear theory of limited redistribution, nonlinear theory, the theory of plasticity). Working relationships for concrete and reinforcing steel, stress-strain fields of RC-section, partial safety factors. Design of RC-sections: bending moments and axial forces, transverse forces and torsional moments. Interaction diagrams. Buckling of RC columns. Strut-and-tie method.

4. Teaching methods:

Lectures, exercises, consultations, preparation and defense of the project.

1. Educational goal:

Introducing students to practical problems and acquiring professional knowledge for the application in practice in the field of water planning and management.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is directly applicable in engineering practice, as well as for understanding and upgrading knowledge from other courses.

3. Course content/structure:

Hydrometrics and hydrology, levelgram, hydrograph, connection between flow and water level, presentable rain and hydrograph, statistic data processing. Hydrotechnical facilities, classification and specificities, water action on hydrotechnical facilities. Building materials, static and dynamic water pressure and influence of seismics, waves, ice action, safety to sliding, turning and rising to the surface. Water filtration beneath facilities, structure instability due to soil structure changes beneath the facility, uplift, measures for uplift decrease. Structure building in the zone of surface water and groundwater action. Hydrotechnical systems, water regulation, flood protection, hydrotechnical melioration, water energy usage, municipal infrastructure systems.

4. Teaching methods:

Teaching is performed interactively in the form of lectures, auditory and computer practice. At lectures, theoretical part of the course content is presented, followed by the characteristic examples for better understanding. At auditory practice, characteristic exercises are solved and the course content is explained in more detail. Apart from lectures and practice, consultations are regular. A part of the course content that makes a logical unit can be taken during the teaching process in the form of partial examinations. Partial examinations are taken in written form and as tests. Examination grade is made on the basis of: lecture and practice attendance, partial examination grade and written examination grade (combined exercises and theory).

Precondition courses

1. Educational goal:

Obtaining knowledge on the specificities of component materials, properties and methods for examining fresh and hardened concrete, designing content and designing concrete, traditional and contemporary technologies for concrete production and performing concrete

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used in professional courses and in engineering practice. Students are competent to select the adequate type of "normal" concretes and design its content, the technology for constructing concrete structures, to monitor and examine the concrete quality during the building process and to elaborate the concrete project. Acquired competencies can be used in designing and building concrete structures.

3. Course content/structure:

Component materials for concrete. Structure and properties of fresh concrete (rheological properties, technological properties, other properties). Structure and properties of hardened concrete (micro and macro structure, basic strength laws, strength under pressure, resistance to compression and shearing, module of elasticity and Poisson's coefficient). Rheological properties of hardened concrete. Special properties of concrete (resistance to frost action, resistance to frost action and melting salts, resistance to wear, water-resistant concrete). Designing content for diverse concrete types. Mixing concrete, transporting concrete, building-in concrete and protecting concrete. Building basic concrete structures. Special procedures for concrete works and building-in concrete. Accelerating the concrete hardening. Concrete works in extreme climate conditions. Concrete quality control. Project on concrete.

4. Teaching methods:

During lectures, presentations with photographs, tables, diagrams, formulas and emphasised text - definitions are used to explain the students the course content predicted by the curriculum. There are also short thematic films. In laboratory practice, students can observe the procedures for mixing concrete and examining basic properties of fresh and hardened concrete. A part of the practice is computing, where students use tasks to connect the presented course content with the construction practice. Professional excursion (a concrete factory and interesting structures under construction with concrete works) is obligatory for all students. The examination comprises theoretical and practical - written part, where the written part is eliminatory. Written part of the examination includes computing tasks. During the semester, the first course field can be taken in one partial examination, and the other field in the examination. Theoretical part of the examination can be taken during the exa

1. Educational goal:

Enabling students for design, application of principles and methods for calculating and dimensioning prestressed elements, as well as for the analysis on the condition of usability of reinforced concrete and prestressed elements.

2. Educational outcomes (acquired knowledge):

Knowledge and application of principles and methods for calculating and dimensioning prestressed elements, as well as the analysis on conditions of usability of reinforced concrete and prestressed elements. Necessary fundamentals for other professional courses in the field of concrete structures.

3. Course content/structure:

Limit states of reinforced and prestressed concrete elements: the calculation of sectional stress-strain distribution, calculation of deflections/deformations and cracks. Limit deflections and crack widths. The design criteria. Review and development of prestressed concrete elements and technical regulations. Prestressing models (pre and post tensioning). Principles, systems and levels of prestressing. Properties of the concrete (concrete creep and shrinkage) and reinforcement (strength, stress relaxation). Working relationships of concrete and steel for prestressing. Concrete creep theory and algebraic stress-strain relationship. Design of prestressed sections and the allowable stresses of ultimate bearing capacity. Short- and long-term time losses of the prestressing force. Cable route, cable anchoring, the length of the introduction of the force and ensuring the elements by reinforcement. Limit state of crack initiation. The application of the PN within linear and shell elements.

4. Teaching methods:

Lectures, exercises, consultations, preparation and defense of the project.

1. Educational goal:

Obtaining knowledge necessary for the analysis on stress and strain of statically indeterminate line structures due to constant and moveable loads.

2. Educational outcomes (acquired knowledge):

Enabling students to calculate and analyse all types of statically indeterminate line girders applied in construction. Acquired knowledge can be used in professional courses and in professional practice

3. Course content/structure:

Survey of basic equation for linear theory on rods. Classic and matrix formulation. Statically indeterminate girders. Force method: basic system, forming and solving conditional equations, solution control. Calculating displacements. Construction of influential lines for statically unknown forces and cross section forces. Influential lines for displacements. Elastic centroid. Approximate deformation method: basic unknowns, deformation indeterminate girders, forming conditional equations and solution control, influence of moveable loads. Hardy Cross procedure. Symmetric girders. Matrix analysis on line systems: basic notions and basic unknowns. Girders in plane: rod stiffness matrix, reaction vector, base stiffness matrix, transformation matrix, compatibility matrix, conditional equations, contour conditions, knot displacement determination, calculating force at rod ends. Orthogonal frames. Spatial girders. Continual girders. Software application for structural analysis.

4. Teaching methods:

Lectures, numerical – graphic practice, consultations. Practice are held in groups, and processed tasks fully follow the lecture content. Condition for taking the exam is positively evaluated individual tasks, as well as the required success at the partial examination or the defended seminar paper.

Precondition courses

1. Educational goal:

Acquiring knowledge in the field of modelling and analysing plates and shells for diverse usage.

2. Educational outcomes (acquired knowledge):

Ability to model and analyse plates and shells for diverse usage.

3. Course content/structure:

Basic notions in the theory on plates and shells. Bending theory on thin plates. Navier's solution. M. Levy's solution. Bending theory on thin circular plates. Finite difference method. Modelling using the finite difference method. Plane theory on plates. Plane stress of plates. Wall girders. Plane strain theory. Plane strain theory in polar coordinates.

Modelling using the finite element method. Membrane theory of shells. Membrane theory of cylindrical shells. Bending theory of rotational circular shells with rotational symmetrical loading. Bending theory of circular cylindrical shells with rotational symmetrical loading. Modelling using the finite element method.

4. Teaching methods:

Interactive work with students in order to continually follow-up the students' knowledge level. Theoretical analysis on phenomena included in the course content and numerical modelling.

Precondition courses

1. Educational goal:

Acquiring knowledge and skills necessary for the design, construction and maintenance of the common structures of timber, glulam and wood-based products.

2. Educational outcomes (acquired knowledge):

Students competence for solving problems of everyday practice in the construction of timber structures.

3. Course content/structure:

Wood as a structural building material. Wood properties - physical, mechanical, technical. Actions, allowed stresses and limit states (ultimate and serviceability). Wood-fire relationship. Fasteners. Design of bearing capacity and stability of the wood elements according to the current regulations. Carpenter joints. Joints and connections with fasteners in the timber structures. Timber roofs: traditional wooden roofs and truss structures. Building systems made from timber and wood-based panels. Glue Laminated timber (glulam) - production, design of straight and curved beams of varying and constant cross-section. Joints, connections and supports of glulam structures. The spatial stability of structures with frame made of solid and/or glulam timber. Assembly, protection and maintenance of timber buildings.

4. Teaching methods:

konstrukcija

Course is done through lectures (PowerPoint presentations), numerical-graphic tasks (ilustrative examples and case studies), as well as tutorials. Attendance is obligatory. Pre-exam obligations are: two design homeworks (independently or in organized teams) with explanation of suggested solution. Exam consist from colloquium, written and oral part. To pass succesfully, students must meet the required knowledge level from all forms of pre-exam and exams obligations.

Enabling students for acquiring professional knowledge and application in practice

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used in professional work in the field of roads.

3. Course content/structure:

Introduction – history, basic postulates, types and specificities of road structures. Road mechanics – models of road structures, fundamental physical and mechanical properties and material fatigue, breaking definitions. Input data – traffic load, formation level, road structure layers – materials. Dimensioning based on empirical methods and calculation models based on road mechanics. Application in diverse road types: flexible, semi-stiff and stiff. Influence of climatic and other factors. Evaluation of road conditions, condition indicators. Designing reinforcement for existing roads.

4. Teaching methods:

Lectures, practice, consultations.

1. Educational goal:

Acquiring knowledge in modelling and analysing geometric nonlinear behaviour of structures and the behaviour of structures for dynamic actions.

2. Educational outcomes (acquired knowledge):

Enabling students for modelling and analysing geometric nonlinear behaviour of structures and the behaviour of structures for dynamic actions.

3. Course content/structure:

Geometric, static and material nonlinearity. Theory of first and second order. Notion of stability. Bifurcation theory. Linear theory of first and second order. Euler's bending cases. Bending lengths. Differential equation of rod bending. Evaluation of rod stability parameters. Stability of rod systems. Deformation method. Modelling the nonlinear structure behaviour. Finite element method. Dynamic load action. Dynamic structural method. Differential equations on system motion with one or more degrees of freedom. Free and forced vibrations of the system with one degree of freedom with and without damping. Free and forced vibrations without system damping with more degrees of freedom. Earthquake action and structural response. Method of analysing structures for seismic action. Principles of aseismic design of high buildings.

4. Teaching methods:

Interactive work with students in order to continually monitor their knowledge level. Theoretical analysis on the phenomena included in the course content and numerical modelling.

Precondition courses			None								

1. Educational goal:

Enabling students in fundamental areas for acquiring professional knowledge and for application in practice.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used as a basis for further upgrading in professional courses.

3. Course content/structure:

Hydrological cycle, precipitation, evaporation and transpiration, infiltration, runoff, small river waters, large river waters, flood wave propagation, water accumulation, thermal water regime. Measuring water level, water mirror fall, water depth, water speed, flow, water sediment movement. Dependency between water level and water flow, water sediment movement and water flow. Data processing.

4. Teaching methods:

Teaching is performed interactively in the form of lectures, auditory, laboratory and computer practice. At lectures, theoretical part of the course content is presented, followed by the characteristic examples for easier understanding. At auditory practice, characteristic exercises are solved and the course content is explained in more detail. At laboratory practice, acquired knowledge is practically applied on the available equipment. Apart from lectures and practice, consultations are regular. A part of the course content that makes a logical unit can be taken during the teaching process in the form of partial examinations. Partial examinations are taken in written form and as tests. Examination grade is made on the basis of: lecture and practice (auditory, laboratory and computer) attendance, partial examination grade and written examination grade (combined exercises and theory).

1. Educational goal:

Training students to work on the design of reinforced concrete elements and structures, their execution and maintenance.

2. Educational outcomes (acquired knowledge):

Knowledge of reinforced concrete elements and their properties in order to optimum use in designing (calculation, modeling and analysis) of reinforced concrete structures of facilities of diverse purpose.

3. Course content/structure:

The concept and basics of reinforced concrete structural design (reinforced concrete properties, design models, methods for determining the static forces, aggressive environment, reliability of structures, the principles of design of elements, complementary behavior of concrete and steel, the theoretical spans, supports, dilatation, ultimate limit states). Linear reinforced concrete elements (beams, columns, frames, arcs, combined linear girders, ring beams, corbels). Reinforced concrete slabs (one- and two-way slabs, flat slabs, circular and annular slabs, openings). Wall beams. RC elements in shallow foundation (footings, strip foundation, foundation beams, grids, slabs). Reinforced concrete industrial facilities (elements, dispositions, analysis and load transfer, and the effects of static systems, design elements, specificity). Multi-story reinforced concrete building (classification, operations, budget and distribution of static forces, the effects of slenderness, aseismic design).

4. Teaching methods:

Lectures, exercises, consultations, preparation and defense of the project.

Precondition courses			None					

1. Educational goal:

Acquiring knowledge on the process of structure building, usage of mechanization and possible technologies for structural and building construction.

2. Educational outcomes (acquired knowledge):

Capability for elaborating bill of quantities for building a structure, analysing construction costs, applying construction mechanization, and analysing working costs, as well as selecting and defining technology for performing special types of works while building. Acquired knowledge can be directly applied in engineering practice.

3. Course content/structure:

Investment and technical documentation. Construction machines (types and properties). Performance of construction machines. Costs of machine works. Technology for structure building. Technology for excavation (working technology, mechanization application, normative and price analysis). Technology of structure production (types of works, mechanization application, normative and price analysis). Specialist trades and finishing operations (types of works, working technology, normative and price analysis). Placing installations in structures. Technology of road network construction.

4. Teaching methods:

Teaching is realized as lectures in the form of presentations on individual methodical units and graphic practice performed individually by students during the class and assisted by an assistant. In practice classes, based on the obtained information (lectures, literature, consultations and general introduction at the beginning of exercises) students solve the set tasks (graphic practice). All completed and positively graded papers are a prerequisite for taking the examination. Examination includes the entire course content presented during the semester, and it is in written and oral form. Written part of the examination can also be taken as two modules during the teaching process. Examination grade is formed on the basis of lecture and practice attendance, points from graphic papers, written and oral examination.

Precondition courses

1. Educational goal:

Enabling students for abstract thinking and acquiring fundamental knowledge in the field of probability and mathematical statistics. Course objective is to develop a special manner of students' thinking in studying mass phenomena in the field of construction – hydraulics. Course character is applicative, hence the significance is placed on the knowledge that can explain the quantitative approach to problems in the field of study. Furthermore, students are becoming capable of using a statistics programme. The aim is to enable students to know how to select adequate statistic methods, elaborate a statistic analysis and explain its essence. This knowledge is the foundation for better understanding of professional literature and successful improvement in the studies.

2. Educational outcomes (acquired knowledge):

Acquired knowledge should be used by students in further education and in professional courses to make and solve mathematical models using the knowledge from this course by adopting theoretical knowledge in the field of probability and mathematical statistics presented in this course, as well as skills for calculating and interpreting final statistic indicators.

3. Course content/structure:

Theoretical course: Probability: Probability axioms. Conditional probability. Bayes' theorem. Random variable of discrete and continual type. Random vector of discrete and continual type and common distribution. Conditional distributions. Transformation of random variables. Mathematical expectations. Variation and standard deviation. Moments. Co-variation, correlation coefficient. Conditional expectations. Laws on large numbers. Central border theorems. Correlation and regression; linear regression. Sample distribution, mean value and dispersion. Statistics: basic notions. Population, sample. Statistics. Descriptive statistic analysis (basic notions, data acquisition, table and graphic data presentation, data analysis by descriptive statistic methods, programme support for static analysis). Evaluation of unknown parameters (Dot evaluations: moment methods and maximal reliability method. Interval evaluation.). Parameter and non-parameter hypothesis and tests. Practice classes: At practice, student do adequate examples from the theoretical classes to practice the presented course content, so that practice help the understanding of the presented content.

4. Teaching methods:

Lectures. Numerical calculation and computer practice. Tutorials. Lectures are performed in a combined manner. At lectures, students are presented with the theoretical part of the course content followed by characteristic examples for easier understanding. At practice, that follow the lectures, students do characteristic exercises and widen the course content from the lectures. At computer practice, using the statistic programme, students do the processing of the obtained results. Apart from lectures and practice, there are regular tutorials. A part of the content that makes a logical unit can be taken during the teaching process in the form of 2 modules (first module: Probability, second module: Statistics).

1. Educational goal:

Training students to work on the design of reinforced concrete elements and structures, their execution and maintenance.

2. Educational outcomes (acquired knowledge):

Knowledge of reinforced concrete elements and their properties in order to optimum use in designing (calculation, modeling and analysis) of reinforced concrete structures of facilities of diverse purpose.

3. Course content/structure:

The concept and basics of reinforced concrete structural design (reinforced concrete properties, design models, methods for determining the static forces, aggressive environment, reliablility of structures, the principles of design of elements, complementary behavior of concrete and steel, the theoretical spans, supports, dilatation, ultimate limit states). Linear reinforced concrete elements (beams, columns, frames, arcs, combined linear girders, ring beams, corbels). Reinforced concrete slabs (one- and two-way slabs, flat slabs, circular and annular slabs, openings). Wall beams. RC elements in shallow foundation (footings, strip foundation, foundation beams, grids, slabs). Retaining walls. Ground floors. Special frame structures of civil engineering facilities.

4. Teaching methods:

Lectures, exercises, consultations, preparation and defense of the project.

1. Educational goal:

Introducing students to practical problems and acquiring professional knowledge for the application in practice in the field of municipal hydotechnics.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is directly applicable in engineering practice.

3. Course content/structure:

1. Drinking water treatment. Contamination of ground and surface waters. Demand for water treatment. Conventional procedure for water treatment. Technological scheme for water treatment. Special drinking water treatments. Finding problems in water treatment plants. 2. Hydraulic analysis on the water treatment plant. Objective and process of hydraulic analysis. 3. Measurement in water supply systems. Types of measurements and categorization of measuring equipment. Equipment for pipe position determination (locators). Equipment for water loss detection. Equipment for water flow measurements. Equipment for water pressure measurements. Water level measurement. Measuring range. Telemetric systems. 4. Mathematical modelling in water supply systems. Water flow modelling. Water supply system modelling. Application of software tools for water supply system simulation.

4. Teaching methods:

Teaching is performed interactively in the form of lectures, auditory and computer practice. At lectures, theoretical content is presented with characteristic examples for easier understanding of the course content. At auditory practice, characteristic tasks are done and course content is presented in more details.

1. Educational goal:

Acquiring knowledge in the process of structure building and in the manners of organizing works during the process of completing building construction and civil engineering structures.

2. Educational outcomes (acquired knowledge):

Ability for making elaborates on the organization and management of a construction site, elaboration of dynamic construction plans, defining and applying protective measures at work during the construction, as well as taking part in organizing and managing a construction site. Acquired knowledge is directly applicable in engineering practice.

3. Course content/structure:

A project on technology and building organization. Construction conditions. Relation between building technology and site organization. Site organization schemes (temporary facilities, application of mechanization). Safety measures and occupational safety in construction. Building organization. Building organization and adopted technology. Researching the operations (application in construction). Planning methods (CPM, PERT, Gantt charts, cyclograms). Plan processing on a computer. Basic documentation in building.

4. Teaching methods:

Teaching is performed in lectures in the form of presentations of individual methodical units and graphic practice done individually by students with the consultations with the teaching assistants. At practice classes, based on the obtained information (lectures, literature, consultation and general instructions at the beginning of practice classes), students solve the set tasks (graphic practice). Completed and positively graded tasks present a prerequisite for taking the examination. Part of practice is held at the computer centre, and completed computer exercises are a prerequisite for taking the examination. Examination covers the entire course content presented during the semester, and it is taken in written and oral form. Written part of the examination can be taken in 2 modules during the teaching process. Examination grade comprises lecture and practice attendance, grade from graphic papers, computer practice, written and oral part of the examination

1. Educational goal:

Introducing students with practical problems and acquiring professional knowledge for the application in practice in the field of drainage and irrigation of agriculture cultures.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is used in engineering practice.

3. Course content/structure:

Fundamentals in designing hydrotechnical amelioration. Processing hydro-meteorological foundations, foundations on soil, water regime in the soil, data on water usage – water balance, etc. Drainage. Surplus water, soil and groundwater (drainage hydro module, time for drainage). Possibilities and manners for surplus water drainage. Drainage systems (open, closed, combined). Designing, construction, exploitation and drainage in the drainage system. Drainage facilities (canals, drains, collectors, pumping stations, bridges, culverts, cascades, dams, etc.). Irrigation. Water balance, water deficit and the role of soil in irrigation. Calculating module, norm and tours of irrigation. Soil irrigation methods (irrigating, overflowing, channels, drop-by-drop, underground irrigation, etc.). Calculating the optimization for the irrigation system. Designing, construction, power and maintenance of the irrigation system. Facilities in irrigation (canals, pipelines, water catchments, pumping stations, regulation facilities, other system facilities).

4. Teaching methods:

Teaching is performed interactively in the form of lectures, auditory and computer practice. At lectures, theoretical content is presented with characteristic examples for easier understanding of the course content. In auditory practice, characteristic tasks are done and course content is presented in more details. Apart from lectures and practice, consultations are also regular. A part of course content that constitutes a logical unit can be taken as a partial examination during the teaching process. Partial examinations are taken in written form and as tests. Examination grade is formed on the basis of: lecture and practice attendance, success in partial examinations and written part of the examination (combined exercises and theory).

1. Educational goal:

Acquiring knowledge in the field of experimental analysis on civil engineering structures by testing experimental loads in order to be familiar with the real structure behaviour.

2. Educational outcomes (acquired knowledge):

Ability for experimental analysis on civil engineering structures by testing experimental loads in order to be familiar with the real structure behaviour.

3. Course content/structure:

Reasons for structure testing by experimental loading. Modelling real structure behaviour. Methodology of testing structures and facilities by experimental loading. Registering deformations on structures and facilities. Measuring displacements on structures and facilities. Determining dynamic structure parameters. Compensating the temperature action. Determining forces in cables for prestressing. Schemes for experimental loading. Modelling structures based on their behaviour under experimental loading. Technical regulative related to structure testing. Elaborate on performed structure testing using experimental loading. Survey on some significant structure testing.

4. Teaching methods:

Interactive work with students in order to continually monitor their knowledge level. Theoretical analysis on the phenomena included in the course content, numerical modelling and results comparison of experimental and numerical analysis.

Precondition courses	· ·		None							

1. Educational goal:

Application of basic acquired knowledge and methods in solving practical problems within the selected area. Students investigate the problem, its structure and complexity, and based on conducted analysis, they draw conclusions on the possible modes of solving. Researching the literature, students are introduced to the methods for solving similar tasks, and the practice in their solving. Obtaining the knowledge on modes, structure and form of writing a report after the conducted analyses and other activities within the set topic of the final thesis. By elaborating the final thesis, students acquire experience for writing their theses where it is necessary to describe problems, conducted methods and procedures, as well as results obtained. Furthermore, the objective of elaborating and defending the final thesis is to develop the ability to use the results of individual work and prepare it in an adequate form to be publicly presented,

2. Educational outcomes (acquired knowledge):

Enabling students for individual application of the previously obtained knowledge in diverse fields being studied in order to observe the structure of the set problem and approach the systematic analysis to draw conclusions on possible directions of its solving. By individually using the literature, students expand their knowledge in the selected field and research diverse methods and theses related to similar problems. By individually researching and solving tasks in the given area, students acquire knowledge on the complexity of the problems in their professional field. By elaborating the Bachelor thesis, students acquire certain experiences that can be applied in practice while solving problems in their professional field. By preparing the results for public defence, in the public defence and on answering questions and comments presented by the committee, students acquire necessary experience on the manners of practically presenting results of an individual or team work.

3. Course content/structure:

Formed for each student in particular, in accordance with the demands and the area enclosed within the set task of the final thesis. The student, in agreement with the mentor, completes the final thesis in the written form in accordance with the regulations of the Faculty of Technical Sciences. The student prepares and defends the written final thesis in public, in agreement with the mentor and in accordance with the prescribed standards. Student researches the professional literature, specialization and final thesis dealing with the same topic, performs analyses in order to find the solution to the concrete task defined in the task of the final thesis.

4. Teaching methods:

The mentor of the final thesis sets the task of the final thesis and presents it to the student. Student is obliged to elaborate the final thesis within the set task defined in the task of the Bachelor thesis. During the elaboration of the final thesis, mentor can provide additional instructions to the student, direct to certain literature and additionally direct in order to have a more qualitative final thesis. Within the theoretical part of the final thesis, student has consultations with the mentor, and if needed, with other teachers dealing with the topics related to the topic of the Bachelor thesis. Within the set topic, if needed, student can conduct certain measuring, researching, counting, surveying and the like, if it is predicted by the final thesis task. Student completes the final thesis and on obtaining the agreement of the committee for evaluation and defence, provides bounded copies to the committee. The defence of the Bachelor thesis is public, and the student has the o

1. Educational goal:

Acquiring knowledge on the process of building assembly structures and the usage of additional equipment and mechanization.

2. Educational outcomes (acquired knowledge):

Ability to plan and realize the process of manufacturing concrete elements for buildings and halls. Ability to plan the transportation of precasting elements. Ability to plan and realize the process of assembling concrete elements for buildings and halls at the site. Acquired knowledge can be directly applicable in engineering practice.

3. Course content/structure:

Basic principles in constructing assembly structures. Types of assembly structures and classification of elements. Precasting methods for assembly elements. Precasting of concrete masonry. Transport of precast elements. Supplementary and main equipment for assembly. Assembly technology and methods. Designing the process for the construction of assembly structures.

4. Teaching methods:

Teaching process is realized through lectures in the form of presentations and through graphic practice which students do individually during the classes assisted by the teaching assistant, and based on obtained information (lectures, literature, consultations and general introduction into practice). All completed graphic papers receive a certain number of points. The examination includes the entire course content from this semester and it is taken in written form (tasks and theory). The examination grade is formed on the basis of lecture and practice attendance, points from graphic practice and written part of the examination.

1. Educational goal:

Obtaining knowledge on the technology of performing contemporary craftsmanship on high buildings and technology of performing installation works.

2. Educational outcomes (acquired knowledge):

Ability in planning, realisation and control of installation and finishing works on high buildings.

3. Course content/structure:

Types of finishing and craftsmanship works on structures (standards and working technology). Application of contemporary materials for finishing operations. Evaluation on quality and billing of finishing and installation works. Installations for water supply and sewerage systems. Electrical installations (weak and strong currents). Mechanical installations (heating, conditioning, installations in industry). Synchronizing building technology and completed works in placing the installations.

4. Teaching methods:

Teaching process is realized through lectures in the form of presentations and through graphic practice which students do individually during the classes assisted by the assistant. At practice classes, based on obtained information (from lectures and general introduction into practice), students solve the set tasks (graphic practice). Students are familiar with the content of the task, so they can prepare and bring literature which can be used during their work. All completed and positively graded tasks present a prerequisite for taking the examination. The examination includes the entire course content from this semester, it is taken in written form and it is eliminatory. The examination grade is formed on the basis of lecture and practice attendance, points from graphic practice and written part of the examination.

Precondition courses			None							

1. Educational goal:

Introducing students to the basic principles of ecologically sustainable building, regulative in the field of environmental protection, basic principles of passive solar architecture, manners in building using natural materials and construction measures for fire protection in buildings.

2. Educational outcomes (acquired knowledge):

Student is enabled to make an ecological analysis of the existing buildings and projects for future structures, as well as to perform environmental evaluation of spatial and urban plans. Student is also able to elaborate the fire protection elaboration for a building, as well as the calculation for the necessary class of fire resistance for building elements.

3. Course content/structure:

Environmental protection measures in spatial planning. Basic spatial – planning principles of ecologically correct building. Classical models for spatial town structure. Solar urbanisation. Reconstruction and revitalization of towns. Macro-fire sectors. Village planning. Construction materials – ecological evaluation. Criteria for ecological evaluation of materials. Energy aspects. Durability of materials and elements in a building. Material behaviour in high temperatures. Natural radionuclides in construction materials. New materials – phase-alternating materials. Building structures – ecological evaluation. Basic principles in ecologically correct building. Dwelling ecology. Energy aspects in building. Bioclimatic and solar architecture. Basic types of self-heating structures. Healthy buildings. Economy of ecological changes in building. Seismic aspects in building. Technical regulative in the field of fire protection. Eurocodes and introduction to fire protection analysis. Construction measures for fire protection.

4. Teaching methods:

Lectures are auditory, within which all theoretical units are illustrated with a great number of practical examples. All topics are related to the elaboration of a graphic paper – a brief for an eco-house, which students complete after lectures in the field of structures and which has to be presented before the theoretical part of the examination as a prerequisite.

Precondition courses			None							

1. Educational goal:

Enabling students to analyse complex problems using construction methods. Theory of elasticity. The character of the course is such as to place the significance of lectures on tensor approach to deformation equilibrium equations and constitutive equations.

2. Educational outcomes (acquired knowledge):

Acquired knowledge should be used in professional courses for the analysis of complex stress conditions, stress concentration and theory on plates and shells. Theoretical bases for the formulation of finite element equations.

3. Course content/structure:

Stress analysis. Equilibrium equations presented via stresses. Transformation of stress tensor: basic directions. Octahedral, spherical and deviation part of stress tensor. Planar stress condition. Deformation tensor. Volume dilatation. General Hook's law. Compatibility equations. Solutions for certain concrete problems. Theory of elasticity. Karman's theory of plates.

4. Teaching methods:

Lectures. Auditory practice. Consultations. At lectures, theoretical part of the course content is supplemented by characteristic examples. At practice, additional exercises are completed in order to expand the course content. Regularly, in previously stated terms every week, consultations are held. On completing the first module (stresses), students take the written examination which is eliminatory. Oral part of the examination is obligatory.

Precondition courses	-		None							

1. Educational goal:

Empowerment of students for design, constructing and maintaining tasks on masonry structures of diverse purpose.

2. Educational outcomes (acquired knowledge):

The knowledge on the materials properties and elements for building in order to be optimally applied in calculation, modeling and analysis of masonry structures and design of diverse purpose facilities.

3. Course content/structure:

Overview and development of masonry structures and technical regulative. Materials for masonry structures: elements for building, mortar, concrete, reinforced and prestressed steel. Application of soil, stone, brick and blocks in building masonry structures. Types of masonry structural elements: bearing and nonbearing (partition) walls, walls with or without reinforced concrete belt course., reinforced and unreinforced walls, prestressed walls, posts, etc. Physical, mechanical and rheological characteristics of unreinforced walls. Conceptual design of masonry structures. Structural systems of masonry buildings. Calculation of masonry structures for the influence of vertical and horizontal load. Seismic analysis and aseismic design of masonry structures. Calculating walls and posts according to permitted stresses and limit bearing capacity. Facade walls on buildings. Foundation walls in buildings. Details of masonry structural elements and their construction. Construction and quality control for works and materials for building. Masonry structures of arches, vaults and domes. Application in religious structures. Application in engineering practice, culverts and bridges.

4. Teaching methods:

Lectures. Numerical tasks practice. Tutorials. Examination is taken as a written test with the questions concerning relevant course content. During the teaching process, students orally defend 1 seminar paper with a topic from the field of masonry structures. Seminar paper is presented in written form containing app. 20 text pages with drawings and figures.

Civil Engineering

Table 5.2 Course specification

Course:										
Course id:	GH405		River Regulation and Flood Protection							
Number of ECTS:	5									
Teacher:		Đurić V.	rić V. Duško							
Course status:		Elective	Elective							
Number of active tead	hing classe	es (weekly	')							
Lectures:	Practical	classes:	Other teaching types:	Study research work:	Other classes:					
3	2	2	0	0	0					
Precondition courses			None							

1. Educational goal:

Introducing students to practical problems and acquiring professional knowledge for the application in practice in the field of river regulation and flood defence.

2. Educational outcomes (acquired knowledge):

Acquired knowledge is directly applicable in engineering practice, designing, building and maintenance of regulatory and defence facilities in and next to the river flow.

3. Course content/structure:

Origin of natural flows. River basin. River valley and river flow, river bed. Hydrological characteristics, water levels and flows, ice on rivers. River morphology, regulative in river flow formation. Gathering, processing and presenting morphological beds. River sediment, origin of river sediment and classification. Calculation methods for river sediment transportation. Works on arranging natural flows. General principles for determining regulation elements. Regulation facilities, classification, materials, disposition in a water flow. Flood defence, hydrological-hydraulic aspects. Data gathering and processing. Selection and analysis on flood waves. Forms of dangerous effects of large waters. Analysis on flood damage, condition for damage appearance, damage categories. Works, facilities and criteria for protection, active and passive measures for flood defence. Ice floods, ice formation conditions, operational ice flood defence. Problems in filtration stability of defence dams.

4. Teaching methods:

Teaching is performed interactively in the form of lectures, auditory and computer practice. At lectures, theoretical content is presented with characteristic examples for easier understanding of the course content. At auditory practice, characteristic tasks are done and course content is presented in more details. Apart from lectures and practice, consultations are also regular. A part of course content that constitutes a logical unit can be taken as a partial examination during the teaching process. Partial examinations are taken in written form and as tests. Examination grade is formed on the basis of: lecture and practice attendance, success in partial examinations and written part of the examination (combined exercises and theory).

Civil Engineering

Table 5.2 Course specification

Course:			Traffic Flow Theory						
Course id:	S0432								
Number of ECTS:	5								
Teachers:		Bogdano	gdanović Z. Vuk, Simeunović M. Milan						
Course status:		Elective	Elective						
Number of active tead	hing classe	es (weekly	′)						
Lectures:	Practical	classes:	Other teaching types:	Study research work:	Other classes:				
3	,	1	1	0	0				
Precondition courses	-		None						

1. Educational goal:

Acquiring fundamental knowledge on the traffic flow, its characteristics, basic indicators of traffic flow and procedures for their measurement and calculations, regularities and relations occurring in a traffic flow and the procedures for the analysis. Calculating a model for dependency presentations between fundamental parameters of a traffic flow in dependence on technical and exploitation road characteristics. Educational objective is also to obtain basic knowledge necessary for investigating the conditions of traffic flows in a road and street network in the fields of planning, managing and designing the traffic infrastructure.

2. Educational outcomes (acquired knowledge):

Application of acquired knowledge for analysing traffic flow on roads, intersections and road facilities depending on their technical and exploitation characteristics, i.e. defining specificities of a traffic flow and determining characteristic parameters necessary for evaluating traffic flow conditions. Application of the acquired knowledge in the traffic flow theory is other areas dealing with the problems in planning and constructing traffic infrastructure, as well as traffic management in the road and street networks.

3. Course content/structure:

Movement of individual vehicles, basic parameters of a traffic flow, vehicle flow, density of a traffic flow, velocity of a traffic flow, travelling time, unit travel time, vehicle space mean intervals, Significant characteristics of a traffic flow, complexity of a traffic flow, general conditions of a traffic regime, content and structure of a traffic flow, non-uniform vehicle flow, relations between basic parameters in a traffic flow, empirical models of interdependency of the basic parameters in a traffic flow, mathematical models for describing the traffic flow, movement of an organized group of vehicles.

4. Teaching methods:

Lectures, auditory and computing practice. At practice, students will analyze parameters of a traffic flow in real conditions. Practical – computing part of the course can be passed by taking the partial examination.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 06. Programme Quality, Contemporaneity and International Compliance

The study programme is coordinated with contemporary trends and situation in profession, and it is compatible with similar programmes in international higher education institutions.

The study programme in Civil Engineering designed in this manner is omniscient and provides students with the latest scientific and professional knowledge in this field.

The study programme in Civil Engineering is compatible with:

- 1. University of Glasgow, Faculty: Engineering, Department: Civil Engineering www.civil.gla.ac.uk/
- 2. Czech Technical University in Prague, Faculty of Civil Engineering, www.fsv.cvut.cz/studente/bakalmag/bc/bce.php
- 3. Politehnika Warszawska, Civil Engineering www.il.pw.edu.pl/index

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 07. Student Enrollment

The Faculty of Technical Sciences, in accordance with the social demands and its own resources, enrols at the undergraduate academic studies in Civil Engineering, at the budget financing and self-financing, a certain number of students that is every year defined by the special Decision of the NNV FTN. The selection of the students and their enrolment is performed among the applied candidates based on their success during the previous education, as defined by the Statute on the enrolment of students to the study programmes.

Students from other study programmes, as well as those with already completed studies, can enrol this study programme. In these cases the Evaluation committee (made by the head of the study programme and all heads of the chairs participating in the realization of the study programme) evaluate all passed activities by the candidates and based on the acknowledged number of points determine whether the candidate can enrol the graduate – Master studies of the selected study group. The passed activities can be accepted entirely, can be accepted partially (the committee can ask for additional work) or need not be accepted.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 08. Student Evaluation and Progress

The final grade at each individual course in this programme is formed by continual monitoring of students' accomplishments and the results obtained during the academic year and on final examinations.

Students master the study programme by taking examinations and thus obtaining a certain number of ECTS credits, in accordance with the study programme. Each course at the study programme has a set number of ECTS credits which students obtain on successfully passing the examination.

The number of ECTS credits is determined on the basis of working activities of students in taking a certain course and by applying the unique methodology at the Faculty of Technical Sciences for all study programmes. Students' success in mastering a certain course is constantly monitored during classes and is presented in points. Maximum number of points obtained in a course is 100.

Students obtain points from a course through their work during classes, fulfilment of their prerequisites and taking the examination. The minimal number of points that can be obtained by a student after fulfilling prerequisites during the teaching process is 30, and the maximal one is 70.

Each course at the study programme has a clear and publicly known mode of obtaining points. The manner of obtaining points during classes includes a number of points given to a student on the basis of each individual type of activities during classes, or by fulfilling prerequisites and taking examinations.

A student's final achievement at a course is presented using grades from 5 (fail) to 10 (excellent). A student's grade is based on the overall number of points obtained on fulfilling prerequisites and taking the examination, and in accordance with the quality of acquired knowledge and skills.

A student can be able to take the examination from a given course if they have at least 15 ECTS credits from prerequisites. Additional conditions for taking the examination are defined individually for each course. Student's advancement during education is defined in the Regulations for Students at Undergraduate Academic Studies.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 09. Teaching Staff

For the realization of the study programme Civil Engineering, there is the faculty staff with necessary scientific and professional qualifications.

Total number of lecturers is adequate to the demands of the study programme and depends on the number of courses performed and the number of classes per course. The total number of lecturers is adequate to cover the total number of classes at the study programme, so that each lecturer has in average 180 classes of active teaching (lectures, tutorials, practice, practical work,...) annually, i.e. 6 classes per week. Out of the total number of necessary teachers, all 100% is employed full-time.

The number of assistants is adequate for the demands of the study programme. The total number of assistants at the study programme is adequate to cover the entire number of classes at the programme, so that assistants have the average of 300 classes of active classes annually, i.e. 10 classes per week.

Scientific and professional qualifications of the teaching stuff are adequate to educational scientific field and the level of their obligations. Each teacher has at least five references from the narrow professional and scientific field in which they hold lectures at the study programme.

The number of students in a group for lectures is up to 180, practice groups have up to 60 students and laboratory practice groups have up to 20 students.

All data on lecturers and assistants (CV, title appointed, references) are available to the public.

Study Programme Accreditation

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 10. Organizational and Material Resources

To perform a study programme, the adequate human, spatial, technical and technological, library and other resources suitable to the study programme features and predicted students' number are to be provided. Teaching at the study programme Civil Engineering is performed in 2 shifts so each student is provided with a minimum of 2 m2 of space.

Lectures are held in amphitheatres, classrooms and specialized laboratories. The library possesses more than 100 library units relevant for the performance of the study programme in Civil Engineering. All courses from the study programme Civil Engineering have adequate textbooks, devices and supplementary equipment available on time and in a satisfactory number for the normal teaching process. There is also adequate information support.

Faculty has the library and the study room and provides a seat for each student in amphitheatres, classrooms and laboratories.

UNDERGRADUATE ACADEMIC STUDIES

Civil Engineering

Standard 11. Quality Control

Estimation of the study programme quality is elaborated regularly and systematically via self-evaluation and external quality control. One should place an emphasis on the multi-decade practice of students' surveys.

The quality control process is conducted through:

- -end of the term students survey for each course
- -survey of the graduating students at the graduation regarding the quality of the study programme and the logistic support. In addition, the conditions for studying (classroom tidiness and neatness, etc...) are also evaluated.
- -survey of the students at the end of the school year. At this point the students evaluate logistics support.
- -survey of the student when enrolling a new school year. Here the students evaluate the study program at the year which they have previously completed.
- -survey of the teaching and non-teaching staff on the quality of the study programme and its logistic support. Here the work of the Dean's office, registrar's office, library, and other services at the Faculty is evaluated. In addition, the conditions for studying (classroom tidiness and neatness, etc...) are also evaluated.

To monitor the quality of the study programme, there is also a committee with all heads of all Departments participating in the realization of the study programme, together with a student from each study group.
