Study Programme Accreditation - PhD Studies

DOCTORAL ACADEMIC STUDIES

Power, Electronic and Telecommunication Engineering

Higher Education Institution Competence for the Implementation of PhD Studies Standard 00.

The Faculty is fully prepared in terms of academic staff, equipment, classroom capacity and other facilities for administering doctoral studies in all fields studied at the Faculty based on indicators related to scientific work and research. The Faculty has a short-term and long-term plan and is accredited as a scientific and research institution, as required by law.

The capability of the Faculty to administer doctoral studies can be verified by the following:

•the number of the Ph.D. and Master theses defended at the higher education institutions which are in the area for which the study programme is accredited, in terms of the ratio of the number of the doctoral and master theses and the number of the students who have graduated from the programme and the number of professors.

•the ratio between the number of the professors and the number of the professors involved in the scientific and research projects.

•the ratio between publications in the Ministry of Science acclaimed international journals in the last 10 years and the number of the professors.

•cooperation with institutions in the country and abroad

•the Faculty employs a number of tenured teachers who have acted as doctoral thesis supervisors.

The capability of the Faculty to administer doctoral studies is obvious from the references which are enclosed with the accreditation material.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication Engineering

Standard 01. Programme Structure

DOCTORAL ACADEMIC STUDIES

The name of the Doctoral Study Programme is Power, Electronic and Telecommunication Engineering. The acquired academic degree is a Philosophy Doctor in Power, Electronic and Telecommunication Engineering. The outcome of the learning process is the knowledge that enables students to become capable of independent scientific research.

Doctoral studies in Power, Electronics and Telecommunication Engineering last three years and they are worth at least 180 ECTS. The first 90 ECTS are obtained through examination of the subjects, 30 ECTS trough laying theoretical basis for doctoral dissertations, and 60 ECTS are acquired by preparing and the doctoral thesis defense.

Doctoral studies last at least three years (six semesters) and no longer than ten academic years.

Research study on theoretical background is a part of the doctoral dissertation qualifying exam for the preparation of the doctoral thesis in which students demonstrate that they have mastered theoretical knowledge in the scientific area of interest. Theoretical foundations are laid as examination (written and / or oral) in certain fields of the study, from at least three courses defined in the study programme.

Student's research interest is profiled by selecting the courses which will be studied, thus contributing to the in-depth knowledge and understanding of the areas (themes) of the doctoral dissertation. Optional courses are selected from the group of the proposed subjects of the study programme. The students have the opportunity to choose a number of courses, as agreed with their mentor (co-mentor), from a set of subjects for Doctoral Studies at the Faculty of Technical Sciences, University of Novi Sad, or any other university in the country or abroad. The conditions for the lecture attendance and other in the selected classes have to be fulfilled.

Teaching activity for the courses (mandatory or optional) is a group or individual (mentoring) activity. Group classes are held when the course is chosen by five or more students or when this type of the training is necessary to organize due to the nature (character) of the subject.

The decision on the type of the instructions and optional courses that are taught is made by the Head of Doctoral Studies and with the consent of the Manager of the Doctoral Studies at the Faculty.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies

DOCTORAL ACADEMIC STUDIES

Power, Electronic and Telecommunication Engineering

Standard 02. Programme Objectives

The purpose of this Study Programme is education of the students capable of high quality and independent scientific research in accordance with the needs of our society. On the other hand, the educating staff who are trained to critically evaluate the research work and independently carry out the original and scientifically relevant research, enables the development of the new technologies and procedures that contribute to the overall development of the society. In addition, the purpose of this Doctoral Study Programme is a contribution to our national science as well as the application of the new scientific solutions to industry and in broader areas of power, telecommunications, electronics and computing.

Study Programme at Doctoral Studies in Power, Electronic and Telecommunication Engineering is designed to provide acquisition of skills that are socially justified and useful. The Faculty of Technical Sciences defined tasks and goals for educating highly competent personnel in the field of technology. The purpose of this Study Programme is completely in line with the high objectives and goals of the Faculty of Technical Sciences and at the level of strict standards of the Ph.D.education worldwide in electrical engineering and computer science.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication DOCTORAL ACADEMIC STUDIES

Engineering

Standard 03. **Programme Goals**

The objective of the study program is to develop student's competencies and academic skills in the field of Electrical and Computer Engineering. Besides, this includes the development of the creative abilities in considering the problems as well as the ability of critical thinking, development of teamwork and mastering specific practical skills necessary to master the profession.

The objective of the study program is to educate an expert who has sufficient extended knowledge consistent with all contemporary directions of the development of the science in the world.

One of the specific objectives in accordance with the educational goals of the experts at the Faculty of Technical Sciences is to develop students' awareness of the need for a personal contribution to the development of the society in general and the environment protection. The objective of the study program is also to educate experts in the field of teamwork and development of the technical capacity for communication and presentation of their original results to the scientific public.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication Engineering

Standard 04. Graduates' Competencies

DOCTORAL ACADEMIC STUDIES

PhD graduates of the academic study programme in Power, Electronic and Telecommunication Engineering are competent to conduct research and solve problems in real life activities. Competencies include, above all, the development of critical thinking skills, the problem analysis capabilities, the synthesis solution, predicting the behaviour of the selected solutions with a clear understanding of what are the advantages and disadvantages of the selected solution.

The gualifications that indicate the completion of the doctoral academic studies, are gained by the students:

•who have demonstrated systematic knowledge and understanding in the field of electrical and computer engineering which is the basis for developing critical thinking and application of knowledge;

•who have mastered the skills and methods of research in this field;

•who have shown the ability of making concepts, design, construction and application of the selected solution:

•who have shown the ability to adapt the research process with the necessary level of academic integrity;

•who have performed original research and work, extending the existing boundaries of knowledge, which is verified by publishing papers in the appropriate scientific journal and by the references at national and international levels;

•who are capable of critical analysis, evaluation and synthesis of the new and complex ideas;

•who are capable of knowledge and ideas transfer to their colleagues, wider academic community and society in general

•who are capable of promoting technological, social and cultural progress in the academic and professional environment

After graduation, the PhD programme allows the students to have the knowledge, skills, developed abilities and competencies to :

•independently solve practical and theoretical problems and organize and develop activities and research; be involved in international scientific projects

•be able to implement the new technologies and procedures in the field of electrical and computer engineering and to understand and use modern knowledge;

•think critically, work creatively and independently;

•respect the code of ethics and principles of good scientific practice:

•be capable to present scientific research results at scientific conferences and publish in scientific journals, verifying them through patents and new technical solutions;

•contribute to the development of scientific disciplines in science generally.

After this study programme completion, the student obtains the following subject-specific competences:

thorough knowledge and understanding of the disciplines that are subject of their involvement;

ability to solve problems using scientific methods and procedures;

linking basic knowledge in various fields and their application;

•ability to follow modern developments in the field of their profession;

•necessary skills and ability in applying knowledge in the field of electrical and computer engineering; •the use of information and communication technologies.

Acquired competences are verified by scientific papers published by the candidate, at least two papers at the international conferences of M33-level (according to the categorization of the Ministry of Science) and at least one paper in the SCI journal list (M21, M22 or M23 level).

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication DOCTORAL ACADEMIC STUDIES

Engineering

Standard 05. Curriculum

The curriculum of the Doctoral Academic Study Programme is supposed to meet the set goals. The structure of the study programme enables the students to choose optional courses which will be worth at least 70% of the ECTS credits.

During the doctoral academic studies, the students are encouraged to specialize in the specific field of the study they are most interested in. Through optional courses they are able to take further interest in the scientific and research areas studied during their graduate academic studies.

All courses last one semester and are worth a certain number of the ECTS credits, one credit comprising approximately 30 hours of the student's activity.

The curriculum defines every course of the study programme and states the following: the course name, type, the year and the semester when the course is to be taken, the number of the ECTS credits, the name of the lecturer, the course objectives with the expected outcomes, the knowledge and competences the student will acquire, the prerequisites for the course, the course content, the recommended literature, the methods of lecturing, the tests and evaluation style and the other relevant data. Each course is designed in a way to provide about half of the class load in the form of lectures and half of the class load in the form of research. The research is an independent work of the PhD student, who has been doing the detailed study in the field of the selected course, as agreed with the course teacher.

The study programme is consistent with European standards regarding enrolment requirements, duration of the study, terms of enrolling into the next year, the acquisition of a diploma and the mode of the study. The curriculum enables students to attend 7 courses during the first three semesters. In the first semester two compulsory courses are taught, namely: the research method and selected topics in mathematics as well as an elective course in which a list of elective courses is included, in the typical fields of electric power engineering, power electronics, electrical machinery, electronics, instrumentation and electrical measurement, telecommunications and signal processing. In the second and the third semester (each containing two optional courses), students elect optional courses after consulting with their mentor, available to every student of the doctoral studies.

In accordance with his/her own preferences, and with the consent of the mentor and the head of the study programme, the student can choose more than one course from the same group of elective courses.

The doctoral studies are worth at least 180 ECTS, out of which at least 90 ECTS are acquired by taking examinations in the courses prescribed by the study programme and research. Additional 90 ECTS are aquired by realization, elaboration and defence of the doctoral dissertation.

The doctoral studies in one study programme last at least 3 (three) academic years (6 semesters), and not more than 10 academic years. The research study in the theoretical framework of the doctoral dissertation is completed by passing a qualifying examination for the doctoral dissertation elaboration. The exam is supposed to show that the student mastered the necessary theoretical knowledge in the chosen scientific field of interest. The student has to pass the examination in the theoretical foundations (either written or oral) in different fields (issues), choosing from at least three courses of the study programme.

The doctoral studies involve classes, research as well as completion and defence of the doctoral dissertation.

The course lectures are carried out either in a group or individually (with a mentor). Group lectures are necessary if more than five students are taking the particular course, or if the nature of the course requires group work. The decision on the type of the lectures and elective courses is made by the Head of Doctoral Studies with consent of the Head of the Doctoral Studies of the Faculty of Technical Sciences.

Before the thesis defence, the candidate is required to have at least one paper published or accepted for publication in the journal with SCI (science citation index) list.

Doctoral dissertation is to be defended before a committee consisting of at least 5 teachers, one of whom has to be from the related academic or scientific institution, but from the faculty other than the Faculty of Technical Sciences. The most of the thesis defense members have to be chosen from the Faculty in respect to the study program.

1. Educational goal:													
To provide students with the advanced knowledge in the field of microwave technology that have not been mentioned in their previous education, and in dependence on their Doctoral dissertation topic.													
2. Educational outcomes (acquired knowledge):													
Advanced knowledge in the field of microwave technology that enables students to elaborate their Doctoral dissertation in the area.													
3. Course content/st	ructure:												
Microwave measurin Part of the course is The study and resea	ng. Specialize conducted tarch work is	ed programn rrough individ based on act	ne software. ual research a ive study of p	and study primary so	Active microwave circu work in the field of micro cientific sources, organization oper in the narrow scien	wave technology. ation and performand	ce of experim	ents and

Table 5.2 Course specification

Course:										
Course id:	DE111		Algorithms for Digital Signal Processing							
Number of ECTS:	13									
Teachers:		Delić D. '	Vlado, Šećerov E. Emil							
Course status:		Elective								
Number of active tead	ching classe	es (weekly	()							
Lectures:	Practical	classes:	Other teaching types:	Study research work:	Other classes:					
5	(0	0 4 0							
Precondition courses			None							

1. Educational goal:

As a main course for the doctoral studies students whose major choice is digital signal processing, this course has an educational objective to provide students with all the necessary knowledge on digital signal processing and its application. It is necessary to consolidate the knowledge from graduate studies regarding digital signals in both time and frequency domains, digital filters and methods for their design. The objective of the course is to increase and deepen students' knowledge by introducing them to the advanced algorithms and applications for digital signal processing. They should get acquainted with the methods for designing optimal filters and adaptive systems which are increasingly utilized in practice.

2. Educational outcomes (acquired knowledge):

Main algorithms for signal processing in discrete time and the most important transformations of discrete signals, including the algorithms for the Fast Fourier transformation. Digital filters are introduced via concrete examples, and only then theory is learned and methods for their design are introduced. Based on the acquired knowledge, students will be able to competently analyse the set problem, select the appropriate digital filter class and optimal design method, design with the usage of adequate software tools and implement a digital filter on the general purpose processor or DSP platform. Students will learn to select optimal structures for the realization and to design even the complex systems for digital signal processing. They will be introduced to the methods for signal spectrum estimation, as well as adaptive systems. In practical work, they will gain experience with the Matlab DSP Toolbox and Simulink.

3. Course content/structure:

•Practical aspects of A/D and D/A conversion and selection theorems. •Transformations of discrete signals and links between them (ZT, FTD, DFT). •Fast FT and fast convolution. •Examples of digital FIR and IIR filters and their characteristics. •Main methods for digital filter design (with the introduction to Matlab DSP Toolbox). •Design methods and the selection of structure for the realization of optimal digital FIR and IIR filters. •Multirate systems. •Adaptive systems. •Frequency spectrum estimation (with the introduction to Matlab Simulink). •Part of the course is conducted through individual research and study work in the field of algorithms for digital signal processing. The study and research work is based on active study of primary scientific sources, organization and performance of experiments and statistic data processing, numerical simulations, and writing a paper in the narrow scientific area within the topic of the Doctoral dissertation.

4. Teaching methods:

Teaching is the combination of lectures and tutorials. Individual students' work is supported by the web portal of the Chair for Telecommunications and Signal Processing. There, they can find PowerPoint presentations from lectures in .pdf format, as well as certain on-line exercises intended for individual work and homework elaboration. During the tutorials, students are led through the selected chapters in the Tasks for Digital Signal Processing with the objective of acquiring additional knowledge to the one from their graduate studies. At the Laboratory for Digital Signal Processing at the Faculty, students obtain practical experience in the work with software tools for digital signal processing and with the development systems for DSP where they perform the implementation of the DSP algorithm. Some of the obtained knowledge is tested during the semester in the form of elaborating short design tasks and homework. During the final examination, the entire knowledge from the course is e

DOCTORAL ACADEMIC STUDIES

Course:	_			· • · · · • • •							
Course id:	DE212	5	Selected Chapters in Acoustics and Audio Engineering								
Number of ECTS:	14										
Teacher:		Delić D. '	Vlado								
Course status:		Elective									
Number of active tea	ching classe	es (weekly	()								
Lectures:	Practical	classes:	Other teaching types:	Study research work:	Other classes:						
5	()	0	4	0						
Precondition courses			None								
1. Educational goal:											

The goal of the course is to provide doctoral students with further knowledge in Audio Signals (spech, music and/or noise) and in Audio Engineering. Numerous topics are covered in classes to a certain extent, after which students will work with a mentor and be encouraged to use further reading materials available at the Telecommunications and Signal Processing Department. A doctoral student selects certain chapters and the extent of study depending on the plan and curriculum he/she has agreed upon with his/her mentor, and in accordance with the subject professor's recommendations. Apart from the elements of physical and psycho-physiological acoustics (what and how we hear), the obligatory part of the curriculum also involves digital techniques for sound recording and reproduction, the up to date audio engineering, as well as the basic means to process and transmit the audio signal.

2. Educational outcomes (acquired knowledge):

Doctoral students acquire necessary knowledge in Audio Signals (speech, music and/or noise), Audio Engineering, and/or Noise Protection. Apart from understanding hearing sound, Electrical Engineering students also learn how to use electro-mechanical- acoustic analogies for acoustic system analysis. After that the students will become familiar with electroacoustic converters (microphones, speakers and headphones), as well as with other devices and equipment, by using which they acquire practical experience at the Acoustics and Speech Technologies Laboratory, as well as by visiting music studios and the play recording complex of Novi Sad Radio Station. Students will also acquire experience in working with electrical-acoustic and measuring devices and learn how to fully evaluate the acoustic space and complete acoustic room processing.

3. Course content/structure:

•Physical Acoustics: Emission and Spreading of Sound, Sound Characteristics. •Physiological Acoustics: Sound Perception and Influence on People (what and how we hear: dB, Phon, Sone, dB(A). •Psychoacoustics: Sound Perception (the intensity, pitch and timbre), binaural sound localization, sound masking effect. •Analogies: electro-acoustic and electro-mechanical analogies. •Electro-acoustic converters: microphones, speakers and headphones. •Electro-acoustic devices: tone technique, measuring devices, filters, amplifiers. •Sound Recording and Production: analogue (magnetic and optical) and digital (disc, CD, DVD, MP3). •Compression and Transmission of Audio Signal: analogue (FM stereo) and digital (GSM, VoIP, DAB-the digital radio). •Room Acoustics: sound in closed space, reverberation time, sound absorbers, acoustic room processing, the acoustics of music and film studios, the acoustics of concert halls, opera houses and churches. •Space sound: indoor and outdoor sound systems. •Music: tune, rhythm, dynamic, music quality, musical instruments, an orchestra seating assignment and recording. •Studio recording: recording of a conversational radio programme or a play with multiple participants, background sounds (effects and noise). •Noise: sources and spreading, noise level and intensity, regulations on acceptable noise level, measuring standards and techniques, noise monitoring in the work and life surroundings, noise reduction and protection methods. •Acoustics in Civil Engineering: noise spreading pathways, the insulating power of barriers, acoustic barriers and protectors.

4. Teaching methods:

Classes are a combination of lectures and tutorial work. Doctoral students' independent work is supported by a Web portal of the Telecommunications and Signal Processing Department. There the students can find Power Point presentations of lectures in the PDF format, as well as numerous on-line practice details intended for individual work and project task completion. The lecture presentations demonstrate and show the key topic details using the audio content and animation. A part of the subject matter involves the work on smaller project papers, while the second part of the course includes the practice work at the Acoustics and Speech Technologies Laboratory at the Faculty of Technical Sciences and at the Speech Studio at UNS, as well as at Novi Sad Radio Station, where the doctoral students are further acquainted with the audio technique, music and speech studies, the silent room and the play complex. A part of the examination involves the completion of a practical project, whose defe

Precondition courses	-										

1. Educational goal:

The aim is to expand and deepen the multidisciplinary knowledge of PhD students related to man-machine speech communication. In order to understand algorithms for speech signal processing, it is necessary to get introduced with features of speech signal and its acoustic and linguistic models. Firstly, to master the application of software tools for audio (speech) signals. Secondly, to understand the algorithms used in speech signal processing, in particular algorithms and techniques for automatic speech recognition and speech synthesis based on the given text. Expand knowledge on the speaker identification and verification, as well as the emotion recognition. Also introduce students to the basics of natural language processing, automatic control of the dialogue and the dialogue system. Finally, to learn about the practical applications based on man-machine speech communication by using speech technologies.

2. Educational outcomes (acquired knowledge):

During the course, the PhD students have to theoretically explore algorithms, used in automatic speech recognition (ASR), speaker identification and verification, as well as in synthesizing speech based on text (TTS). In addition, they will practically master most of the software tools and techniques for processing speech signals. In this way, they acquire all the necessary background for understanding algorithms for ASR and TTS. Hence, necessary knowledge is acquired for recording and processing of speech databases and working on development of multimodal systems where ASR and TTS are applicable. Learn about the basic elements of natural language processing and dialogue management. At the end of course they are familiar with the capabilities of automatic speech recognition and synthesis, as well as tools for developing applications and dialogue systems based on these new speech technologies and are willing to provide technical and scientific contributions in this field.

3. Course content/structure:

•Physiological acoustics and acoustic modelling of speech. •Psycho-acoustics and perception of sound. •Articulation and acoustic phonetics. •The Fundamentals of formal languages theory. •Linguistic modelling of speech. •Pre-processing of speech signal and extraction of relevant features. •Recording and processing of speech database for ASR and TTS. •The theory of finite automates and statistical models, hidden Markov models (HMM). •Viterbi algorithm, vector quantization, clustering, parsing techniques. •Algorithms based on the samples comparison and dynamic programming (DTW). •Statistical approach based on HMM. •Expert systems for automatic speech recognition. •Neural Network (ANN) and hybrid systems (ANN-HMM). •Algorithms for speaker's identification and verification. •Morphological and syntactic analysis of text. •Concatenative approach to text-to speech synthesis. •Speech synthesis in the time domain. •Parametric synthesis of speech. •Natural language processing (NLP) and dialogue management (DM). •Telephone and Internet voice portals (CTI, IVR). •Automation of call centre (Call Centre). •Applications in the household, industry, cars. •Humane application of speech technology. •Learning Serbian as a foreign language by using voice machine. •Using standard software tools for development of applications with speech technologies (SAPI, VoiceXML). A part of the course is being realized through individual research study in the field of man-machine speech communication. The research study includes the overview of bibliography, organization and performance of experiments and statistical data processing, numerical simulation, writing of papers closely related to scientific and educational area of the doctoral dissertation topic.

4. Teaching methods:

Teaching involves a combination of lectures, working with a mentor and research study. The independent work of Ph.D student is supported through the Web portal. Students have Power Point presentations with lectures in .pdf format, as well as certain on-line exercises designed for individual work and accomplishing project tasks at their disposal. During the course they have audio and animation presentations in order to demonstrate and illustrate the key details. A part of teaching material is accompanied by a small project work, while the rest of the course is supported by exercises in the laboratory of acoustics and speech technology at FTN and in the voice studio of UNS. A part of the examination is related to the development of a practical project which is a pre-defence obligation and may be the basis for the doctoral thesis. The final examination checks the complete knowledge acquired during this course.

Table 5.2 Course specification

Course:			Advanced Methods of Monitoring and Management					
Course id:	DE513							
Number of ECTS:	14							
Teachers:		Milanovid	lilanović V. Jovica, Sarić T. Andrija					
Course status:		Elective	Elective					
Number of active teac	hing classe	es (weekly	()					
Lectures:	Practical classes:		Other teaching types:	Study research work:	Other classes:			
5	0		0	4	0			
Precondition courses			None					

1. Educational goal:

Discussing the main areas of implementation of the system of monitoring and management (SMU), including off-line and real-time applications. Acquiring knowledge and comprehension of the dynamics of power systems, the interaction between different elements of power systems and their individual and combined impact on different aspects of a power system stability. Encouraging students to use skills and knowledge acquired through the study of mathematics and the general theory of automatic management in solving engineering problems in power systems, and to promote a multidisciplinary approach to solving engineering problems.

2. Educational outcomes (acquired knowledge):

Knowledge and competencies: Identify the main components and characteristics of SMU and understanding of how to implement it in practice; Application of Phasor Measurement Units and communication technologies for the design of SMU's; Understanding the reasons and the need to implement a SMU, understanding the fundamental concepts, principles and theory of the dynamic behavior of the individual elements of the power system; proper understanding of the overall dynamic behavior of the power system, as well as the methods and techniques used to provide dynamic performance of power system capacity. Designing SMU's needed to repair the security, stability and reliability of the power system a; verification requirements for SMU in the optimization and improvement of security, stability and reliability of the power system, and develop a model of a small power system for the study of dynamic power system and perform simple dynamic studies of the power system.

3. Course content/structure:

Explaining the needs of power systems for introducing systematic monitoring and management (SMU) (2) Fundamentals of Synchronous Measurement Technology (2) Designing and planning of SMU (2); SMU application in off-line and real-time (2); Typical examples and standardization SMU (1); stability of a power system - a basic concept of stability (1): Types of stability of power systems, basic concepts and definitions of the stability of a power system, detailed modelling of synchronous machines and some associated regulatory systems (2): Modelling of synchronous generators, excitation system modelling, modelling of turbines and regulators. Requirements modelling and techniques for solving problems of small and large disorders (2): Providing and improving the stability of power system (1) Dynamic performance of isolated distribution networks for various types of distributed energy sources.

4. Teaching methods:

Nine hours of computer-based laboratory exercises. Before taking the exam, a report on the completed exercises has to be made.

Precondition courses None								
1. Educational goal:								
The aim of the course is to offer students an overview and fundamental understanding of the latest techniques of image and video compression and to highlight the problems and present solutions for the efficient transmission of multimedia content over modern packet data network with a focus on wireless technology.								
2. Educational outcomes (acquired knowledge):								
on the quality of the received image / video after reconstruction, 4) be aware of and understand the mechanisms that protect from the multimedia data transmission losses, 5) Obtain an overview of techniques for robust applications and efficient transfer of multimedia in wireless communications networks of the last generation.								
3. Course content/stru	ucture:							
Course content includes the following topics: 1) Basic standards for compression and image and video processing: information-theoretic basis of compression, 2) Basics of JPEG 2000 standard for Image compression and a H.264 AVC / SVC standard for video compression, 3) Packet Multimedia and resilience to packet losses, measures the quality of the reception facilities, 4) protection techniques against losses multimedia transmission over packet networks, codes with nonuniform data protection, 5) The transfer of multimedia over the Internet and wireless transmission network (DVB-H, SH, NGH) or wireless mobile systems (LTE, LTE-A) of the last generation.								
4. Teaching methods:								
Lectures: (Mentor with the student chooses one or more modules, depending on the scope of the module). The theoretical part is followed by examples which serve to clarify the theoretical part of the curriculum. In addition to lectures, tutorial classes (consultations) are held regularly. Through research study, student makes an overview of scientific journals and other literature, and deepens on its own the curriculum provided through lectures. In addition to working with the teacher, the student is trained to write its own scientific work.

developro in appropro- storage	The outcome of education of young colleagues is to enhance theirs knowledge and skills, through independent and team work, for development and improvement of techniques for channel modeling and equalization, error-correcting and modulation encoding/decoding in appropriate channels for magnetic and optical data storage. Through the scientific and research work in the field of construction of new storage media, then coding and detection techniques, colleagues will be able to make significant technological contribution in order to achieve high-density recording, and thus for further increase of capacity of memory devices for these two data storage technologies.

1. Educational goal:										
used for optimization the objective is also to existing and building wind power plants, p demanding, one of th example Retscreen).	The course objective is to give insight to students on fundamental aspects of planning PES, and methodology and algorithms which are used for optimization of certain problems of development planning of production capacities and transmission networks. Apart from that, he objective is also to enable students for solving certain practical problems of expanding of transmission network (reconstruction of the existing and building of new lines) and planning of new production capacities, especially renewable ones – micro and mini hydro plants, wind power plants, photo voltage power plants and the like. Since most of the problems in PES planning are mathematically very demanding, one of the objectives is also to teach students to use available ready-made programming packages for PES planning (for example Retscreen). Also one of the objectives is consideration of impact of power market deregulation on the process of optimal planning of PES parts.									
planning of PES parts. 2. Educational outcomes (acquired knowledge):										
Model some physical Formulate and solve planning of developm Use programme pack	2. Educational outcomes (acquired knowledge): During this course students can: Model some physical effects which appear in some planning problems, Formulate and solve basic planning problems, consumption planning (forecast), planning of development of production capacities and planning of development (expanding) transmission networks. Use programme packages for planning real production and transmission networks Reach conclusions on the basis of the obtained results for the purpose of optimization of PES expanding.									
					i					
Role of planning in the networks. Fuel costs Forecast of energy an Consumption forecas (correlation) model in (maximal) power. Pla PES planning and eng Fundamentals of engi values. Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication Engineering

Programme Quality, Contemporaneity and International Compliance Standard 06.

The Study Programme is consistent with modern world's scientific development and the status of the profession, and comparable to similar programmes in the foreign higher education institutions. Power, Electronic and Telecommunication Engineering Study Programme is designed as complete and comprehensive and offers students the latest scientific and technical knowledge in this area and follows the new achievements in science.

Power, Electronic and Telecommunication Engineering Study Programme is comparable to and in compliance with:

1. Vienna University of Technology, Vienna, Austria

DOCTORAL ACADEMIC STUDIES

(web site: www.tuwien.ac.at/tu vienna/)

2. Faculty of Electrical Engineering and Information Technology, University of Hannover, Germany (web site: http://www.et-inf.uni-hannover.de/index.php?id=english-information)

3. Faculty of Electrical Engineering, Graz University of Technology, Graz, Austria

(web site: http://portal.tugraz.at/portal/page? pageid=75,2344042& dad=portal& schema=PORTAL)

The Study Programme is formally and structurally consistent with the adopted subject to specific standards for accreditation and conformity with European standards in terms of enrolment, length of study, conditions for the progress to the next year and method of study.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication

DOCTORAL ACADEMIC STUDIES

Engineering

Standard 07. Student Enrollment

Each year, in accordance with the social needs and resources, Faculty of Technical Sciences (FTS) enrolls a number of students for the doctoral studies at the Department for Power, Electronic and Telecommunication Engineering, and it is defined by a separate decision and proposal of the founder and Scientific-Educational Council of the Faculty. Enrollment of the students in the doctoral studies is monitored by the Commission for Registration. The Commission for Registration consists of the Head of PhD studies at FTS and the Directors of the Ph.D. programme of study within the Faculty.

The first year of the doctoral studies can be attended by a person who has:

• completed appropriate undergraduate academic studies and graduated with at least 300 ECTS credits total and obtained the overall average score of at least 8,00 on the basic academic and graduate academic studies-master, or the equivalent rating from the other rating system, or if the student is one of the top 20% of all the students in his generation, or

• the academic title of Master of Sciences in appropriate scientific field and if the student did not obtain the title of Doctor of Philosophy in engineering by earlier legislation in force within the period established by the Law.

A person who has completed the study according to the regulations prior to adoption of the Law on Higher Education may enroll to the doctoral studies, under the same conditions as the person who has completed undergraduate academic degree - Master studies, provided that the diploma is equivalent to the Diploma with at least 300 ECTS, which is proved by the decision on recognized equivalence.

Appropriate Graduate academic studies - Master and scientific field are determined for each study programme separately. Exception registration may be granted to other candidates after taking differential exams. The decision on taking differential exams and their character has to be made by the Commission for registration of the Study programme. Candidates who successfully pass the differential exams may be registered at the doctoral studies as self-financed students, if the positions are not filled.

Commission for Registration consists of the executives from the Ph.D. Programme of study along with the Faculty Head of Ph.D. studies.

The Commission for Registration prepares a list of candidates based on the average scores, the length of the studies as well as on number of published scientific papers. Commission for Registration may decide to organize further evaluation of the knowledge of the candidates through the achievement test.

Candidates who obtained the title of the associates of the Faculty or the scholars of the Republic Ministry of Science and Provincial Secretariat for Science and Technology have gained the advantage of financed studies.

In addition, candidates are required to show the knowledge of the world languages and appropriate computing skills.

MA students or Master degree earlier acquired under applicable legislation can be accepted to recognize or acknowledge the partial amendment to the registration by the Commission, provided that the candidate has not spent more than four (4) years at postgraduate studies.

After the enrolment, an agreement has to be extablished between the students and the Faculty on the rights and obligations during the study.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication Engineering

DOCTORAL ACADEMIC STUDIES

Standard 08. Student Evaluation and Progress

The final grade in each course included in this programme is formed by continual monitoring of the students` accomplishments throughout the academic year and by passing the final examination. Students master the study programme by taking examinations and thus obtaining a certain number of the ECTS credits, in accordance with the study programme. Each course within the programme is worth a certain number of the ECTS credits obtained upon successful completion the course examination.

The number of the ECTS credits is based on the quantity and quality of the student's work. The students are required to pass a certain course under the Faculty of Technical Sciences' unique methodology for all study programmes. Student's success in mastering a certain course is constantly monitored during classes and is expressed in points. Maximum number of the points per course is 100.

The students can obtain the points from a course through their work during the classes, completion of the prerequisites and by taking the examination. The minimal number of the points the student can obtain by fulfilling the course prerequisites during the classes is 30, the maximum is 70.

Each course of the study programme has a clear and transparent way of obtaining the points. There are several ways the students can obtain the points: by participating in different activities during the classes, by fulfilling the course prerequisites and by passing the course examination.

The final success of the student is presented with a grade between 5 (fail) and 10 (excellent). The student's grade is based on the overall number of points obtained by fulfilling prerequisites and taking the examination, and in accordance with the quality of acquired knowledge and skills.

Studying at the study programme is carried out in the following way:

The Head of the Study Programme (the study group), upon admission, assigns to every student a comentor from the existing teaching stuff of the study programme. The co-mnthoro will be student's councillor until she/hs chooses a mentor. At the end of each semester, the co-mentor submits to the Head of the Study Programme a report on the student's progress in the research and the achieved results.

Admission requirements into the next year of the programme (the third semester) are met by the student who obtains at least 30 ECTS credits during the first year of studying, with a relative average grade (R) being at least 8.00 (eight 00/100). The relative average grade (R) is calculated based on the course grades, relative to the number of the credits each course carries (the formula is specified amongst the Faculty of Technical Sciences' Rules of Study).

The right to take the qualifying exam in order to be able to write and defend the doctoral dissertation (a research study of the theoretical basis for the doctoral thesis) is granted to the students who have completed the second year of the studies and passed all the examinations within the study programme, 3 academic years after their admission into the programme at the most, and with a relative average grade no lower than 8.00 (eight 00/100).

The students who do not fulfil the requirements to take the doctoral thesis theoretical exam are given a chance, after accrediting all the previously passed exams, to continue the studies at the Specialist Academic Studies of the same Faculty.

The research study on the Theoretical Framework for the Doctoral Dissertation is a gualifying examination for the student who has to pass it before writing the doctoral dissertation. In the gualifying examination the student demonstrates the necessary theoretical knowledge in the field of interest. The Theoretical Framework exam is taken in written or oral form, in areas from at least three courses of the study programme. The list of the areas (questions) that have to be studied for the qualifying exam are sent to the student by the Head of the Study Programme of the Doctoral Studies within 14 days after the student submits a request. The qualifying examination is taken in front of a committee of at least three members, appointed by the Head of the Doctoral Studies and at the Study Programme Quality Committee's suggestion. The Theoretical Framework examination cannot be taken sooner than 30 days, after the student's request, or later than 12 months after the student has passed his last examination at the study programme. Exceptionally, if the student publishes an article (or the article is accepted for publication) in a SCI list journal (M21, M22 and M23), he/sne may be exempted from the explicit examination process and is awarded the highest grade 10.

Examinations at the Doctoral Studies cannot be taken more than twice.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication Engineering

DOCTORAL ACADEMIC STUDIES

Standard 09. Teaching Staff

For the realization of the study programme in Power Engineering, Electronics and Telecommunications there is teaching staff with necessary professional and scientific qualifications, verified by the list of scientific papers and data on participation in national and international scientific and research projects. At least half of the teachers participate in scientific and research projects. Teachers' competence is determined based on the number of scientific papers published in international publications, where at least one paper has been published or accepted to be published in a publication from the SCI list; scientific papers published in the national publicarions; papers published in proceedings from international scientific conferences; monographs; patents; textbooks; new products or significant improvements on the existing products.

The thesis supervisor must have at least five scientific papers published or accepted to be published in the scientific journals in the given scientific field. It has been accepted that the thesis supervisor cannot have more than five Doctoral dissertation candidates simultaneously. The selection of a supervisor is determined in such a manner that each supervisor must have at least five papers published in the journals from the SCI list.

The number of teachers coincides with the demands of the study programme and depends on the number of the courses they teach, and the number of the course hours per week. Out of the total number of the necessary teachers, all 100% are full time employed. A minimal number of the teachers participating in the given study programme with full time employment is five.

Scientific and professional qualifications of the teaching staff relate to the educational and scientific field and the level of their participation. Each teacher has at least 10 references from the scientific or professional field in which they lecture on the study programme.

No teacher has more than 12 classes per week. All data on teachers (CV, selections, and references) are available to the public.

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication

Engineering

Standard 10. Organizational and Material Resources

DOCTORAL ACADEMIC STUDIES

To perform the study programme, the adequate human, spatial, technical and technological, library and other resources suitable to the study programme features and predicted students` number are provided. To perform the study programme, the adequate space for lecturing is provided, as well as the adequate laboratory space necessary for the experimental work and the contemporary equipment necessary for qualitative and productive scientific and research work. Lectures are held in classrooms and specialized laboratories.

Faculty provides the usage of the library fund from its own or other sources (books, monographs, scientific magazines, other periodicals) in the amount necessary for the Doctoral study programme. Doctoral study students have the access to databases (KOBSON, IEEE, etc) necessary for Doctoral dissertation elaboration and scientific and research work.

The library possesses more than 100 library units relevant for the performance of the study programme. All courses from the study programme have adequate textbooks, devices and supplementary equipment available on time and in a satisfactory number for the normal teaching process. There is also adequate information support.

Study Programme Accreditation - PhD Studies Power, Electronic and Telecommunication

Engineering

Standard 11. Quality Control

Estimation of the study programme quality is elaborated regularly and systematically via self-evaluation and external quality control. One should place an emphasis on the multi-decade practice of students` surveys.

Study programme quality control is elaborated in the following manners:

- Surveying students at final lecture from the given course.

DOCTORAL ACADEMIC STUDIES

Surveying students on the quality of the study programme and logistic support to the studies in the event of awarding the Diploma. Also, the studying comfort (classroom cleanness and tidiness) is evaluated there.
Surveying students during the confirmation on completing a year of studies. Then students evaluate the

logistic support to the studies. - Surveying students on enrolling each year of studies. Then students evaluate the study programme at the year they completed in the prior academic year.

- Surveying the teaching and non-teaching staff on the quality of the study programme and the logistic support to the studies. This survey evaluates the work of the Dean's office, Registrar's office, library, and other services at the Faculty. Furthermore, the studying comfort (classroom cleanness and tidiness) is also evaluated.

To monitor the quality of the study programme, there is also a committee with all heads of all Departments participating in the realization of the study programme, together with a student from each study group.

Additional quality is obtained by the obligatory scientific production of candidates. Prior to beginning the defence of the Doctoral dissertation, each candidate is obliged to publish at least 2 (two) papers in the M33 rank (following the categorization provided by the Ministry of Science) and at least one paper in the journal from the SCI list.
