SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 00. Introduction

Study program of specialized academic study "Energy Efficiency in Buildings" is a continuation of the study of the MA-academic studies in the field of civil engineering and architecture at the Faculty of Technical Sciences in Novi Sad. Three departments establish it: Department of Civil Engineering and Geodesy, Department of Architecture and the Department of Energy and Process Engineering.

Improving the energy efficiency of existing buildings and designing new energy-efficient buildings is one of the priorities of modern society. The main objectives of the strategy of energy efficiency is reducing energy consumption for heating and cooling of buildings, conservation of non-renewable energy sources and reducing carbon dioxide emissions. These goals can be achieved primarily by proper design and selecting appropriate materials for construction, taking into account local climatic conditions and the use of renewable energy sources.

Therefore, energy efficiency in buildings in terms of education should be viewed as a study program created in response to the practical needs. This program should enable students to further concretize the knowledge that is based on an understanding of the basic principles of energy efficiency in various fields of technology, acquire additional expertise in energy efficient buildings, acquire the ability to integrate knowledge, and also, to enable students to take part into research work.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 01. Programme Structure

The name of the study program of these specialized academic studies is "Energy Efficiency in Buildings". Acquired academic title is Specialist civil engineer - energy efficiency in buildings. The outcome of the learning process is the knowledge that enables students to use literature, the application of knowledge for problems that arise in the profession, and to ensure the continuation of the study if student decide to do so.

Requirements for admission to the program are completed Master studies with at least 300 ECTS, primarily in the field of civil engineering and architecture and passed the entrance exam. The entrance examination is in the form of knowledge test from the field of energy efficiency in buildings (maximum 60 points) and it is considered to be passed if the candidate achieves at least 14 points.

For specialized academic studies Energy Efficiency in Buildings, which last one year, classes are organized if there are enough students. If there are not enough candidates, classes are not organized or Faculty Management brings a special decision on the organization of teaching (mentoring students).

Classes are organized as mandatory and elective courses. Elective courses are selected from the group of proposed courses, but students have the opportunity to, according to own preferences and desires, choose a certain number of courses from FTS, UNS or any other university in the country or abroad, with the approval of the Head of the study program. In doing so, the courses should be selected to allow expansion of knowledge in areas that are directly or indirectly linked to the energy efficiency of buildings, while at the same time, conditions determined for attendance of selected courses must be satisfied.

Teaching is organized through lectures and exercises. During the teaching process, accent is placed on independent research student work, as well as increased students involvement in the learning process. Courses are conducted by using appropriate didactic materials with direct reference to the research trends in the subject area. Exercises, which follow the lectures, cover concrete problems and examples that further illustrate the material. On exercises is additionally explained material from the lectures. Exercises can be auditory, laboratory, informatical or calculus. Number of exercises can be performed in other institutions or on site.

Group size is determined depending on the nature of the exercises. Student obligations on exercises may include the writing of seminar papers and homework, project assignments, semester and graphic works, while every activity of students during the teaching process is monitored and evaluated according to the rules, which are adopted at the Faculty level. Number of points is expressed by a unique methodology and reflects student workload.

Each course carries a certain number of ECTS, and the entire study is considered complete when a student fulfill all obligations under the program of study, and when it accumulates at least 60 ECTS.

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 02. Programme Objectives

The purpose of the study program is to educate students for the profession of specialist engineers for the construction industry - energy efficiency in buildings, according to the needs of society.

Study program "Energy Efficiency in Buildings" is designed to ensure the acquisition of competencies that are socially justified and useful. The Faculty of Technical Sciences has defined specialized tasks and objectives to educate highly competent personnel in the field of technical sciences. The purpose of the study program "Energy Efficiency in Buildings" is fully consistent with specialized tasks and objectives of the Faculty of Technical Sciences.

With realization of this kind of study program are educated specialist engineers for energy efficiency in buildings with competence in the European and world scale.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 03. Programme Goals

The aim of the study program is to achieve competence and academic skills in the field of "Energy Efficiency in Buildings". This means, among other things, the development of creative abilities to consider the problem, critical thinking, developing skills, teamwork and mastery of specific practical skills needed for the profession.

The aim of the study program is to educate professionals who have profound knowledge sufficient in energy efficiency of buildings, applied to the field of sustainable architecture and construction, improving HVAC performance of buildings, the introduction of renewable energy sources for heating and cooling of building and automation of technical systems in buildings.

One of the specific objectives, consistent with the goals of education of experts on the Faculty of Technical Sciences, is to develop in students the awareness of the need for permanent education, the development of society and the environmental protection. The aim of the study is to educate students in the field of teamwork, and also to develop communicational and professional skills to present their results.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 04. Graduates` Competencies

Graduates of specialized academic study "Energy Eficiency in Buildings" are competent to deal with the real problems of practice and continue their education if they choose to do so. Competencies include, above all, the development of critical thinking skills, ability to analyze problems, synthesis solutions, predicting the behavior of the chosen solution with a clear idea of what is good and what is bad in the chosen solution.

Qualifications gained through completion of specialized academic studies have students that:

- •Shows profound knowledge, understanding and skills in selected research fields of specialization, based on knowledge and skills acquired in graduate academic studies and research relevant to the given research fields of study;
- •Are able to apply in-depth knowledge and skills acquired during specialist studies for successful solving of complex problems in new or unfamiliar conditions, in the research fields of study;
- •Have an increased ability to link knowledge and solve complex problems and based on available information make conclusions that also include consideration of the social and ethical responsibilities linked to the application of their knowledge and judgments;
- •Are able to effectively monitor and acquire new trends and research results in the field of specialization and in a clear and unambiguous manner present their conclusions, knowledge and reasoning process to professional and general public.

In terms of specific students skills, by mastering the program of specialized academic studies, students gain a thorough knowledge and understanding of all disciplines of study program, as well as the ability to solve practical problems with the use of scientific methods and procedures. Graduates of the study program "Energy Efficiency of Buildings" are able to properly write and to present the results of their work. During the study, it is insisted on the intensive use of modern laboratory and field equipment and related software.

Graduates of this level of study have competence to monitor the implementation and innovation in the profession, as well as to cooperate with local and international environment.

Students are able to analyze all the parameters of energy efficiency in buildings, to design energy-efficient buildings and to organize and manage the process of construction of such facilities. During courses, student gains the ability to independently perform experiments, statistical analysis of results, and to formulate and adopt appropriate conclusions.

Graduates of the study program "Energy Efficiency of Buildings" gain knowledge on how to cost-effectively use natural resources of the Republic of Serbia, in accordance with the principles of sustainable development.

Special attention is paid to the development of skills for teamwork and the development of professional ethics

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

Energy Efficiency in Buildings

Standard 05. Curriculum

Curriculum of specialized academic study "Energy Efficiency in Buildings" is formed to meet all of our goals. The structure of the study program is to provide elective courses with at least 30% of the credits.

Through elective courses, students meet their preferences, which crystallize during the study.

All courses last one semester and carry an appropriate number of ECTS credits, where one credit equals approximately 30 hours of student activities.

In the curriculum are defined descriptions of each course that contains the name, type of course and semester, the number of ECTS credits, name of the teacher, the course aims with appropriate outcomes, skills and competencies, prerequisites for attending the course, course content, suggested references, teaching methods, the method of assessment and evaluation, and other data.

The study program is compliant with the European standards in terms of admission requirements, length of study, graduation and modes of study.

An integral part of the curriculum "Energy Efficiency in Buildings" is a professional practice and practical work for 45 hours organized in the relevant scientific research institutions, organizations for innovation activities, in organizations for providing infrastructural support to innovation activities in companies and in public institutions.

A student finishes studies with specialist thesis that consists of theoretical and methodological preparation necessary for in-depth understanding of the area from which the specialist work is and with preparation of the specialist thesis.

Prior to the finalization of specialist thesis, the candidate takes exam on the theoretical and methodological foundations. The final grade of the thesis is based on the grade achieved on the theoretical and methodological part of the exam and grade of the thesis. Final thesis is defended before a committee consisting of at least three teachers, with at least one from another department or faculty.

1. Educational goal:

Acquiring knowledge and skills necessary for the design and construction of energy efficient buildings.

2. Educational outcomes (acquired knowledge):

The gained knowledge will be used for the energy certification of buildings. Candidates will be trained in the analysis of urban and bioclimatic aspects of energy efficiency in buildings. Students will learn the methodology and calculation methods of energy use for heating and cooling of buildings, as well as methods of calculating emissions of CO2.

3. Course content/structure:

EU Directive (ERVD in 2002. And 2010. G.). The experience of European countries. Architecture and urban planning aspects of the energy efficiency of buildings: site selection, building orientation, the influence of wind, greens (bioclimatic architecture). Energy gains: Thrombus-Misel wall, skylights. The basic laws of thermodynamics. Heat conduction in bodies. Building physics. Methodology for calculating the energy needed for heating and cooling (SRPS EN ISO 13790). Examples of calculations for specific objects. Example of making of Elaborate energy efficiency for a specific plant. Example of passports of energy efficiency of a new or existing facility.

4. Teaching methods:

Lectures, laboratory exercises and auditory; Consultation.

Exam (which includes all materials) consists of three homework assignments (work), seminar (tests) which represents the Study of energy efficiency of given the object and final exam. Students who do not pass the oral exam over homework and tests, take oral part of the examination. grading of exam is based on attendance of lectures and exercises, grades of homeworks and success in examinations.

1. Educational goal:

Knowledge gain about thermal environment parameters, comfort conditions, district heating systems, air-conditioning and sanitary hot water, and also about calculation methodology of annual energy consumption needed for building technical systems operation.

2. Educational outcomes (acquired knowledge):

Gained knowledge is used in engineering practice. Student is competent for use of calculation methodology of energy needs for heating, cooling, air-conditioning and production of sanitary hot water, as well as for application of improvement measures of energy efficiency technical systems.

3. Course content/structure:

Thermal comfort: environment parameters, conditions of comfort, meteorological and climate conditions and solar radiation, project conditions. Heat transfer through building envelope: transmission, radiation and ventilation and air-conditioning; heat bridges, condensation appearance. District heating systems: system types, elements and additional equipment, central and local regulation of system operation, measurement of heat used for heating and calculation methods of annual needed heating energy. Systems of ventilation and air-conditioning: individual central devices for air preparation; elements and equipment of air and water air-conditioning systems, calculation of heat load and needed air flow for air-conditioning, protection of solar radiation during the summer periods. Systems of SHW preparation: project conditions and dynamic of SHW consumption, system losses; solar systems for SHW preparation. Annual energy consumption for cooling and air-conditioning: cooling heat and cooling machines, coefficient of energy efficiency, final and primary energy. Optimization of thermal systems operation: use of recovery heat, regeneration, recuperation, adiabatic cooling, passive cooling and night air-conditioning; maintainance and control of system operation.

4. Teaching methods:

Lectures; Laboratory and auditory exercises; Consultation. Exam (including the whole lecture material) is consisting of oral exam (theoretical and calculations). During the semester of course lectures, oral exam could be passed through two colloquiums. Students who did not pass oral exam through the colloquiums, are obliged to pass oral exam at exam periods. Course mark is formed on presence at lectures and exercises, mark of self example and success on colloquiums, i.e. the exam.

1. Educational goal:

Training to work on following tasks: design, construction, operation, engineering and consulting services for the use of renewable energy sources in building sector.

2. Educational outcomes (acquired knowledge):

Gaining of basic knowledge about renewable energy sources and its use in building sector. Using gained knowledge in further education and engineering practice.

3. Course content/structure:

Introductory considerations. Primary and secondary energy sources. Renewable energy types and energy resources, space requirements, regulations. Solar power, directly or indirectly, active and passive use of solar energy, the sanitary hot-water preparation and heating requirements for the building, budget and equipment selection. Ground and surface water, soil (horizontal and vertical heat exchangers), outside air, geothermal water: systems, calculation and equipment selection. Heat load facility, share of renewable energy in the building heat load. Heat pump, the principle of work, the coefficient of heat, monovalent and bivalent mode, the choice of a heat pump. Biomass, wind energy. Cost-benefit analysis of the use of renewable energy in construction, energy savings, investments, assessment of economic feasibility, examples of calculations.

4. Teaching methods:

Lectures, exercises, consultations, mentoring. Visits to facilities with systems developed for the use of renewable energy sources. Testing knowledge on oral examination. Rating exam is based on attendance of lectures and exercises, reviews of the project work and the oral exam success.

1. Educational goal:

Acquiring knowledge about basic bioclimatic conditions relevant for energy efficient building and landscaping, as well as to assess the utilization of natural conditions in the already developed areas.

2. Educational outcomes (acquired knowledge):

The knowledge gained is applicable to engineering practice. The student is capable the proper approach to the organization of space and shape of objects with respect to bio-climatic conditions. He is capable of evaluating the condition of existing buildings in terms of application of bioclimatic conditions, and also has knowledge and giving guidance and suggestions for future interventions.

3. Course content/structure:

Natural forces such factor in the development and organization of space. Bio climatic parameters as a factor in the development of the settlements. Climatic conditions of the area. Micro climatic conditions as a result of the spatial organization and structure of the village. Interdependence and the need for harmonization of natural and man-made conditions. The choice of location and size of facilities (manufacturing, center, square, garden, residential building ...). Orientation of objects and surfaces. Criteria to build bio climatic principles. Criteria for evaluation of existing structures and surfaces in terms of bio-climatic conditions. Reconstruction of the space bio climatic aspects in order to create an energy efficient and rational structure and surface. Change of development, population density, levels, shapes and sizes of objects, setting protective green zone, quantitative and qualitative changes of space equipment ...

4. Teaching methods:

Lectures, graphic and auditory exercises; Consultation. During the semester in which hears the case, the exercises to prepare material for the final term study. Term paper covers two phases of work, both theoretical and practical part. After the completion of certain phases of work provides for the oral presentation of research results. At the end of the semester is taken and a written examination in the theoretical part of the material that is completing the class. The final grade in this course is based on regular attendance of lectures and exercises, reviews of the paper and oral presentations, as well as the written exam.

1. Educational goal:

Gaining knowledge about the basic aspects of the detection and quantification of energy losses of buildings and building up a database necessary for their recovery projects and rehabilitation.

2. Educational outcomes (acquired knowledge):

The knowledge gained is used in engineering practice. The student is competent to independently produced programs of identification and quantification of energy losses based on the use of satellite multispectral detection, air recording infrared sensors and mobile systems integrated GPS, inertial and thermal technologies and sensors. Students will be competent to independently create and use database objects energy loss in the process of recovery projects and the issuance of passports energy.

3. Course content/structure:

Subjects like basic principles of satellite remote sensing, computer processing of multispectral images with classifications. Case studies will be different satellite systems that are currently on the market. Content classification methods of satellite images and aerial thermal cameras performed during operation of the heating system in the urban areas will be determined the existence of energy losses and their quantification. The same methodology is used for data collection and recording video and thermal cameras integrated into the system with GPS technology and inertial systems (INS). The system is mobile (mounted on a vehicle or helicopter) and to collect a lot of information on the energy losses through the facade of objects and their parts. The technology of GPS and INS allows georeferencing losses for each object individually. These data can be organized according to the principles of Geographic Information Systems (GIS) and put at the disposal of the users in the process of project rehabilitation, reconstruction and development of energy passports of individual objects or large urban areas. The technologies of gathering and processing information on the energy losses of facilities for the urban complex will be illustrated by its applications to concrete examples.

4. Teaching methods:

Lectures; Laboratory exercises and auditory; Consultation. Prerequisites: 30% of points should be provided through the partial examination and obligatory tasks, during the teaching process. Exam (which includes all materials) consists of an oral part (theoretical and practical). During the semester in which hears the case, the oral exam can pass through two tests. The practical part of the exam will be taken in the examination periods. Students who do not pass the oral exam through tests, will have oral exams in examination periods. Rating exam is based on attendance of lectures and exercises, essay reviews and success in examinations, ie. examination.

Precondition courses			None						

1. Educational goal:

Introduce students to the concept of intelligent buildings, technical systems in modern buildings and technology management.

2. Educational outcomes (acquired knowledge):

The student is able to understand the technical subsystems in modern buildings, their configuration and mutual integration of electromechanical systems and control concepts. The knowledge is used in engineering practice.

3. Course content/structure:

The definition of intelligent buildings. Technological systems in intelligent buildings. Introduction to digital control systems, analogue / digital input / output values, sensors, actuators, digital controllers. Control algorithms and regulator adjustment. Computational Intelligence. Basic communication standards and their characteristics. Management in boiler rooms and mechanical rooms. Control of central heating systems, cooling and ventilation. Control of central air conditioning systems. The integration of electromechanical systems. Lighting and blinds control systems. Measuring energy consumption (smart networks). Monitoring and control systems.

4. Teaching methods:

Teaching is conducted through lectures and exercises. During the exercises the student is required to do practice-oriented tasks. Evaluation of knowledge is carried out through the subject project and the final exam. The requirement for taking the final exam is that the student must successfully complete the project. The final exam is in written form.

Lectures:	Practical	classes:	Other teaching types:	Study research work:	Other classes:				
3	()	1	0	0				
Precondition courses			None						

1. Educational goal:

The goal of this course is to provide students with a fundamental understanding of the interdependence between the building envelope, environmental conditions within the building and energy performance of the building. The theoretical and physical mechanisms of heat conduction and diffusion of water vapor through the building envelope elements will be explained. The different types of building materials and their basic properties, the correct selection and qualitative evaluation of certain materials and structural systems will be studied. Students will learn the basic principles and features of field and laboratory equipment for testing the energy performance of buildings, as well as the basic properties of building materials.

2. Educational outcomes (acquired knowledge):

At the end of this course, students will be able, on the basis of analysis of properties of construction materials and the understanding of the physical processes that control the behavior of the building envelope, to choose the most energy efficient materials. By proper selection of the system for the building envelope (facades and external walls, roofs and roofing materials), students will be able to model the performance of thermotechnical performances of building in the design process of buildings. Based on the understanding of the basic principles of field and laboratory equipment, students will be able to perform field tests and measurements, to analyze and interpret the results and to diagnose the energy performance of buildings.

3. Course content/structure:

Basic physical and mechanical properties of building materials, which are important for building thermotechnical performances, their functionality and durability. Classification of materials pertaining to their insulating properties, vapor permeability, bulk density, porosity, water absorption, frost resistance, etc.. Types of traditional building materials that can be used for building facades, exterior walls, floors, ceilings floors, roofing, etc.. Modern building materials and the analysis of their properties, with emphasis on their ability to improve the energy performance of buildings and their environmental suitability. Methods and laboratory and field equipment for the diagnosys of building thermotechnical performance.

4. Teaching methods:

In the lectures, through presentations using images, tables, charts, formulas and accompanying text, matter that is provided in the curriculum, will be explained. There should also be discussion in which all students are actively involved, as well as participation of representatives of manufacturers of building materials and equipment for field testing. In the laboratory exercises, students will actively participate in the study of basic properties of building materials and become familiar with the application and the capabilities of laboratory and field equipment for testing of energy performance of buildings.

1. Educational goal:

The goal of this course is to provide students with an understanding of the basic principles and methods of calculation of energy efficient buildings. The features of various software packages for the analysis of the energy performance of buildings and the practical solution of the problem of providing of energy efficient buildings will be explained.

2. Educational outcomes (acquired knowledge):

At the end of this course, students will be able to perform the necessary calculations of those properties and performance of buildings and equipment, some of which directly influence the energy efficiency of new buildings. For existing buildings, students will be able to calculate all the parameters, based on which they can evaluate their level of energy efficiency.

3. Course content/structure:

Design measures to ensure the energy efficiency of buildings. Calculation of heat transfer through the building envelope elements. Calculation of water vapor diffusion. Calculation of heat losses. Calculation of ventilation losses. Calculation of the economic feasibility of investing in additional thermal insulation of the building, as well as the use of renewable energy sources. Calculation of the achieved energy efficiency of the building.

4. Teaching methods:

In the lectures, the matters envisaged by the curriculum, will be explained. There should also be discussion in which all students are actively involved, as well as participation of representatives of companies that develop software for calculating the energy efficiency of buildings. In the computer exercises, students will learn about the capabilities of the various software packages for the design of energy efficient buildings.

1. Educational goal:

The application of basic theoretical, methodological, scientific, technical and professional knowledge and application of methods to solve specific problems within the selected area. In this part of the thesis, student analyzes the problem and the complexity of its structure and based on the analysis, draws conclusions on the possible ways of solving it. Through analysis of literature, students are introduced to the methods intended for solving similar tasks and engineering practice in solving them. The aim of the activities of students in this part of the research is to acquire the necessary experience in solving complex problems and tasks and to use previously acquired knowledge into practice.

2. Educational outcomes (acquired knowledge):

Training students to independently apply previously acquired knowledge in various areas that have been previously studied, in order to review the structure of the given problem and its system analysis in order to draw conclusions on possible directions for its solving. Through the use of literature independently, students expand their knowledge of the chosen field and study of various methods and papers relating to similar issues. In this way, the students develop the ability to conduct analysis and identify problems within the given topic. Practical application of acquired knowledge in different areas develops the student's ability to look at the place and role of engineers in the chosen field, the need to cooperate with other professions and teamwork.

3. Course content/structure:

It is formed in accordance with the individual needs of the preparing of a thesis, its complexity and structure. Students analyze literature, perform the analysis in order to find solutions to specific task which is defined by specialist thesis. Part of teaching at the course is conducted through independent study research. Study work includes active monitoring of the knowledge of primary area of thesis, organization and conduction of experiments, numerical simulation and statistical analysis of data, writing and / or disclosure of paper at the conference of specific scientific areas to which thesis belongs.

4. Teaching methods:

Mentor of thesis prepares the task and submit it to the student. The student is required to work within the framework of the given topic, using literature proposed by the mentor. During the development of specialist thesis, a mentor can give students more guidance, refer to specific literature and further directed him to the production of quality specialist thesis. In the research study, the student consults with the mentor, and if necessary, with other teachers who are dealing with the topics of the field of thesis. Within a given topic, the student, if necessary, perform certain measurements, tests, surveys and other research, statistical analysis, if it is provided by specialist thesis task.

1. Educational goal:

Acquiring knowledge about the structure and form of writing reports after completing analyzes and other activities implemented within the given topic of thesis. Through creating a thesis, students gain experience in writing papers within which it is necessary to describe the problem, the implemented methods and procedures and obtained results. By addition, the goal of writing and defending thesis is to develop the ability to prepare results of independent work in a suitable form, publicly present, as well as to respond to comments and questions about a given topic.

2. Educational outcomes (acquired knowledge):

Training students for a systematic approach to solve the given problem, implement analysis, application of acquired and acceptance knowledge from other areas in order to find a solution for given problem. Self-studying and solving tasks in the field of a given topic, students gain knowledge of the complexity of the problems of their profession. Through creating thesis, students gain some experience that can be applied in practice in solving the problems of their profession. Through preparation of the results for public defense, answers to questions and comments of the committee, student acquires the necessary experience on the way to present the results of independent or collective work.

3. Course content/structure:

Formed in accordance with the individual needs of the area that is covered by a given specialist thesis. Student in consultation with the supervisor makes specialist thesis in written form in accordance with the prescribed rules of the Faculty of Technical Sciences. Students prepare and defend a specialist thesis in consultation with the supervisor and in accordance with the prescribed rules and procedures.

4. Teaching methods:

During the development of specialist thesis, student consults with mentor and, if necessary, other teachers who deal with the subject area of the thesis. Student makes specialist thesis and then after being approved by the Commission for assessment, deliver hardcopy of the thesis to the Commission. Defense of the specialist thesis is public, and the student is required to answers to the questions and comments after the presentation.

1. Educational goal:

The aim of the course is that students understand the importance of improving the thermotechnical and other performance of existing buildings to increase their energy efficiency. Through this course, students need to acquire the necessary knowledge about available methods and materials for thermal rehabilitation of buildings and their energy for revitalization.

2. Educational outcomes (acquired knowledge):

Students will be able to analyze the current state of energy inefficient buildings to choose and design effective techno-economic measures for energy rehabilitation of buildings.

3. Course content/structure:

The analysis of the characteristic systems of the buildings in Serbia, in terms of the used materials and structural solutions. Methods for assessing the thermotechnical performance of existing buildings and defining their deficiencies. Thermal rehabilitation techniques for building, with techno-economic analysis of the achieved heat gains. Examples of executed energy revitalizations of buildings.

4. Teaching methods:

In the lectures, students will be introduced to a substance which is intended by the curriculum. In the discussion on certain classes all students willactively participate. In the auditory and computer exercises, practical examples will be shown, and then students will independently analyze the performance of existing buildings and will propose solutions for buildings energy revitalization.

1. Educational goal:

Enabling students for abstract thinking and acquisition of basic knowledge in the field of Probability, Mathematical Statistics and Numerical Mathematics. The course objective is to develop special way of thinking in students while studying mass phenomena in the field of Civil Engineering. The course has an application character, and therefore the importance is placed on the knowledge able to explain quantitative approach to the problem in the field of study. Besides, students are trained to use statistical software. The objective is to enable students to choose adequate statistical methods, to perform statistical analysis and to essentially justify it. This knowledge is the base for better understanding of the professional literature and for successful advancement in the studies.

2. Educational outcomes (acquired knowledge):

The student should use acquired knowledge in further education, and in the professional courses he/she should make and solve mathematical models using the knowledge acquired in this course. Mastering the theoretical knowledge in the field of probability and mathematical statistics studied in this course and skills of calculating and analyzing the calculated statistical indicators.

3. Course content/structure:

Theoretical lectures: Probability: Axioms of probability. Conditional probabilities. Bayesian formula. Random variable of discrete and continuous type. Random vector of discrete type and joint distribution. Conditional distribution. Transformation of random variables. Mathematical expectation. The variance and standard deviation. Moments. Covariance, coefficient of correlation. Conditional expectations. Large number laws. Central limit theorems. Correlation and regression; linear regression. Sample distribution, mean value and dispersion. Statistics: basic concepts. Population, sample. Statistics. Descriptive statistical analysis (basic concepts, data editing, tabular and graphical data representation, data analysis by descriptive statistics methods, software support for statistical analysis). Evaluation of unknown parameters (dot estimates: Method of moments and method of maximum likelihood. Interval estimates). Parametric and nonparametric hypotheses and tests of importance. Numerical solution of the linear equation systems: direct methods, iterative methods. Numerical solution of nonlinear equations. Numerical solution of the nonlinear equation systems. Interpolation and approximation: interpolation methods, mean square approximation, approximation using spline, spectral approximation. Numerical integration: Newton-Coates formulas, quadrature formulas of Gaussian type. Practical lectures (Practice): During the practice, adequate examples from the theoretical lectures are solved, thus practicing the presented knowledge and also contributing to the better understanding of the knowledge

4. Teaching methods:

Lectures; Numerical Computing and Computer Practice. Consultations. Lectures are combined. During the lectures, theoretical part of the course is presented followed by the typical examples for better understanding of the knowledge. During the practice, which accompanies lectures, typical problems are solved and the lectured knowledge is deepened. During computer practice, processing of obtained data is carried out by using the statistical software. Besides lectures and practice, consultations are held on a regular basis. A part of the course, which represents a logical whole, can be passed during the teaching process in the form of the following 2 modules (the first module: Probability and mathematical statistics; the second module: Numerical mathematics.)

1. Educational goal:

Gaining direct knowledge in the domain of Software engineering and Information Systems Design. Enabling the students to understand the impact of different software development methods in complex business information system development and the role of software in the enterprise architecture of business systems. The special accent is given to the team based and project based learning.

2. Educational outcomes (acquired knowledge):

After succesfull completition of the course students acquire knowledge and skill concerning the organization and functionality of business information systems, analysis of business systems and underlinning busines logic, busines logic modelling, business data modelling in the domain of energy effitiency.

3. Course content/structure:

The definitions and types of business systems. Organizational structure and the levels of business systems organization. Object modeling of business systems. The fundamentals of business informatics, Hierarchy of business information systems. Subsystem and standards. Business information systems development methodologies. Encapsulation of business information systems. Reengineering and reverse engineering of complex business information systems.

4. Teaching methods:

The complete programme is delivered via tim based project on energy efficiency standards implementation, development.

1. Educational goal:

Getting basic knowledge related to the problem of functional and decorative lighting in buildings.

2. Educational outcomes (acquired knowledge):

The emphasis of the course is placed on the internal functional lighting as well as energy efficiency light sources. Also, the basis of internal and external decorative lighting will be presented. Students will gain basic knowledge about the types of light sources, the adequacy of their use in different situations, mutual benefits and disadvantages, their basic technical parameters of light, energy efficiency and so on. By studying the international standard about lightning, students will learn about the regulations in the field of lighting in the area of building construction. Students will be trained in using modern software tools DIALux or similar software tool to quickly determine / verify the parameters of the indor lightning and thus propose an adequate solution.

3. Course content/structure:

- The concept of light - the light source types (principle, Illumination parameters, advantages and disadvantages), - Energy efficiency of different light sources - Introduction to standards in the field of lighting (Illumination parameters are recommended for specific purposes and the types of buildings and premises) - Introduction DIALux software tool or similar software tools

4. Teaching methods:

Lectures, exercises and semester work.

Energy Efficiency in Buildings

Standard 06. Programme Quality, Contemporaneity and International Compliance

The study program is consistent with the modern world scientific developments and the state in the profession, and is comparable with similar programs at foreign universities.

Study program "Energy Efficiency in Buildings", designed at given way, is a complete and comprehensive and provides to students the latest scientific and technical knowledge in this field.

Study program "Energy Efficiency in Buildings" is comparable and compatible with:

1. University of Stanford, Department of Civil & Environmental Engineering, "Sustainable Design & Construction", http://cee.stanford.edu/programs/construction/documents/CEM-DCI- DC_Curriculum.pdf 2. University of Hong Kong, Department of Architecture, "Building Energy Efficiency",

http://www.arch.hku.hk/research/beer/ 3. University of Colorado, Department of Civil, Environmental, and Architectural Engineering, "Energy Efficient Buildings" http://rasei.colorado.edu/index.php?id=348&pid=348&page=Energy_Efficient_Buildings&parent=64 4. Concordia University, Faculty of Engineering and Computer Science, Building, Civil and Environmental Engineering, "Energy Conversion, Building Science, Building Environment", http://graduatestudies.concordia.ca/publications/graduatecalendar/current/encs/bcee.php

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 07. Student Enrollment

In accordance with social needs and resources, Faculty of Technical Sciences every year admit a number of budgetary financed and self-financing students on the specialized studies "Energy Efficiency in Buildings". The number of students is defined by a special decision of Scientific and Academic Council of FTS. Selection of students and enrollment of candidates is based on success in previous studies and achieved success on the entrance exam, which is defined in the Regulations on student enrollment in courses.

Students from other programs of study as well as those with completed studies may enroll in this program. In doing so, the evaluation committee (consisting of the heads of all departments involved in the implementation of the program study) evaluate all the activities of candidates for admission based on recognized total score and determines whether a student can be enrolled in specialized studies. The activities can be recognized in full, or may be recognized in part (Commission may require appropriate amendment) or not recognized.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 08. Student Evaluation and Progress

Continuous monitoring of the students work and results during the course and the final exam forms the final grade on each of the courses of this program.

In accordance with the program of study, every course in a program has a certain number of ECTS credits, and student acquire a number of ECTS credits when successfully passes the exam.

ECTS credits is determined based on student workload while working on certain course and applied uniform methodology of Faculty of Technical Sciences, for all study programs. Student success in mastering a particular course is continuously monitored during classes and is expressed in points. The maximum number of points that student can achieve is 100.

Student gets points through the work during course, exam prerequisites and by completing and passing the exam. The minimum number of points that a student can earn by completing exam prerequisites during classes is 30 and the maximum 70.

Each course in the study program has a clear and published way to score points. Way of gaining points during the course involves a number of points that the student receives based on each type of activity during classes or completing given prerequisites and taking exams.

Overall success of students is expressed with grades, 5 (failed) to 10 (excellent). The grading is based on the student's total number of points earned by a completing exam prerequisites and passing the exam, according to the quality of the acquired knowledge and skills.

In order to take the exam, student has to collect at least 15 ECTS from exam prerequisites during the semester. The additional requirements for the exam are defined separately for each course.

Progress of the student during program is defined by the rules of study.

FACULTY OF TECHNICAL SCIENCES 21000 NOVI SAD, TRG DOSITEJA OBRADOVIĆA 6

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 09. Teaching Staff

For the realization of the study program "Energy Efficiency in Buildings" are provided the teachers with the necessary professional and academic qualifications.

Number of teachers meets the needs of the study program and depends on the number of courses and the number of hours on these courses. The total number of teachers is sufficient to cover the total number of classes in the study program, so that the teacher achieves an average 180 hours per year (lectures, consultations, exercises, practical work ...), or 6 hours per week. Of the total number of teachers, more than 80% are full-time employed.

Number of associates meets the needs of the study program. The total number of associates on study program is sufficient to cover the total number of classes in this program, so that associates achieve an average of 300 hours of lectures per year and 10 hours per week.

Scientific and professional qualifications of the teaching staff are appropriate to the educational and scientific fields and their level of indebtedness. Every teacher has at least five references from specific scientific or technical fields in which teach in the study program.

Group size for the lecture is up to 32 students, group for exercises is up to 16 students and a group for laboratory exercises is to 8 students.

None of all teachers is loaded more than 12 hours per week. All data on teachers and associates (CV, elections in the title, references) are available to the public.

technology Motion control and application of MEMS (112) Industrial Engineering, Specialised Academic Studies (112) Engineering Management, Specialised Professional Studies (110) Engineering Management, Specialised Academic Studies (110) Industrial Engineering, - Product Lifecycle Management and Devolopment, Master Academic Studies (110) Industrial Engineering, - Product Lifecycle Management and Devolopment, Master Academic Studies (110) Industrial Engineering, - Advanced Engineering Technologies, Master Academic Studies (111) Industrial Engineering, - Advanced Engineering Technologies, Master Academic Studies (111) Industrial Engineering, - Advanced Engineering Technologies, Master Academic Studies (111) Industrial Engineering, - Advanced Engineering Technologies, Master Academic Studies (111) Industrial Engineering, Master Academic Studies (112) Engineering, Master Academic Studies (113) Engineering, Master Academic Studies (114) Industrial Engineering, Master Academic Studies (115) Engineering Management, Master Academic Studies (116) Industrial Engineering, Master Academic Studies (117) Industrial Engineering, Master Academic Studies (118)		ID	Course name	Study programme name, study type						
Book	24.	HDOS12		(I12) Industrial Engineering, Specialised Academic Studies						
27. MDROS Selected chapters in enterprise's design, organization (112) Industrial Engineering, Specialised Academic Studies (122) Engineering Management, Specialised Academic Studies (123) Engineering Management, Specialised Academic Studies (124) Engineering Management, Specialised Professional Studies (126) Engineering Management, Specialised Professional Studies (127) Engineering Management, Specialised Professional Studies (128) Engineering Management, Specialised Professional Studies (129) Engineering Management, Specialised Academic Studies (129) Engineering Management, Master Academic Studies (127) Engineering, Advanced Engineering Technologies, Master Academic Studies (NT) Industrial Engineering, Advanced Engineering Technologies, Master Academic Studies (120) Engineering, Advanced Engineering Technologies, Master Academic Studies (120) Engineering, Advanced Engineering Technologies, Master Academic Studies (210) Engineering, Advanced Engineering Technologies, Master Academic Studies (210) Engineering, Advanced Engineering, Specialised Academic Studies (120) Engineering, Advanced Engineering, Specialised Academic Studies (120) Engineering, Master Academic Studies (120) Engineering, Master Academic Studies (120) Engineering, Master Academic Studies (120) Engineering, Specialised Academic Studies (120) Engineering, Master Academic Studies (120) Engineering, Master Academic Studies (120) Engineering, Master Academic Studies (120) Engineering Management, Master Academic Studies (120) En	25.	HDOS13	Motion control and application of MEMS	(I12) Industrial Engineering, Specialised Academic Studies						
MDROS Selected chapters in enterprise's design, organization and control	26.	HDOS14	Nonindustrial automation	(I12) Industrial Engineering, Specialised Academic Studies						
28. MBA414 Integrated Business Processes	27.	IMDR0S		(I22) Engineering Management, Specialised Academic						
PLNUS Cycle and Development, Master Academic Studies	28.	MBA414	Integrated Business Processes	Studies (IB0) Engineering Management - MBA, Specialised						
31. NIT06 Advanced Technologies for Manufacturing Support Technologies, Master Academic Studies	29.	PLM09		(I1U) Industrial Engineering - Product Lifecycle Management and Development, Master Academic Studies						
32. NIT08 Fundamentals of Computer Science and Informatics 33. GS006 Intelligent Buildings 34. H799 Fieldbuses and protocols 35. H828 Advanced robotics 36. H845 Motion control 37. I903 Application of microelectromechanical systems 38. IIDS6 Selected chapters in automation 39. IMZ716 Automation systems in insurance 40. IMZ716 Automation and Robotics in Construction 41. IMZ721 Systems for detection, alarming and warning 42. GD018 Automation and Robotics in Construction 43. HDOK13 Research in the area of automation in HDOK13 44. HDOK13 Selected Chapters in Automation Systems Integration 45. HDOK14 Non-industrial Automation 46. HDOK15 Selected Chapters in Automation Systems Integration 47. HDOK14 Non-industrial Automation 48. HDOK13 Selected Chapters in Automation Systems Integration 49. HDOK14 Non-industrial Automation Systems in Judomation Systems Integration 40. HDOK14 Non-industrial Automation Systems in Judomation Systems Integration 40. HDOK14 Non-industrial Automation 41. HDOK13 Selected Chapters in Automation Systems Integration 42. GD018 Automation and Robotics in Construction 43. HDOK16 Properties of the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 44. HDOK16 Non-industrial Automation 45. HDOK17 Non-industrial Automation 46. HDOK-3 Selected Chapters in Automation Systems Integration 47. HDOK19 Non-industrial Automation 48. HDOK19 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 49. HDOK19 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 49. HDOK19 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 49. HDOK19 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 49. HDOK19 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 49. HDOK19 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studi	30.	NIT02	Factory Automation							
32. Native Fundamentals of Computer Science and Informatics Technologies, Master Academic Studies 33. GS006 Intelligent Buildings (G10) Energy Efficiency in Buildings, Specialised Academic Studies 34. H799 Fieldbuses and protocols (H00) Mechatronics, Master Academic Studies 35. H828 Advanced robotics (H00) Mechatronics, Master Academic Studies 36. H849 Motion control (H00) Mechatronics, Master Academic Studies 37. H903 Application of microelectromechanical systems (H10) Industrial Engineering, Master Academic Studies 38. HB256 Selected chapters in automation (H12) Industrial Engineering, Master Academic Studies 39. HM2516 Artificial Intelligence in Engineering (I20) Engineering Management, Master Academic Studies 40. HM2716 Automation systems in insurance (I20) Engineering Management, Master Academic Studies 41. HM2721 Systems for detection, alarming and warning (I20) Engineering Management, Master Academic Studies 42. GD018 Automation and Robotics in Construction (G00) Civil Engineering, Doctoral Academic Studies 43. HD0K12 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 44. HD0K13 Motion control and the application of MEMS (H00) Mechatronics, Doctoral Academic Studies 45. HD0K14 Non-industrial Automation (H00) Mechatronics, Doctoral Academic Studies 46. HD0K-3 Selected Chapters in Automation Systems Integration (H00) Mechatronics, Doctoral Academic Studies 47. HD0K13 Motion control and application of MEMS (H00) Mechatronics, Doctoral Academic Studies 48. HD0L12 Research in the area of automatic identification (H00) Mechatronics, Doctoral Academic Studies 49. HD0L14 Nonindustrial automation (H00) Mechatronics, Doctoral Academic Studies 49. HD0L14 Nonindustrial automation (H00) Mechatronics, Doctoral Academic Studies 49. HD0L14 Nonindustrial automation (H00) Mechatronics, Doctoral Academic Studies 49. HD0L	31.	NIT06	Advanced Technologies for Manufacturing Support							
34. H799 Fieldbuses and protocols (H00) Mechatronics, Master Academic Studies 36. H828 Advanced robotics (H00) Mechatronics, Master Academic Studies 37. H845 Motion control (H00) Mechatronics, Master Academic Studies 38. H845 Motion control (H00) Mechatronics, Master Academic Studies 39. SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 10. Organizational and Material Resources

To perform the study program are provided human, physical, technical, technological, library and other resources that are appropriate to the nature of the study program and the anticipated number of students. Teaching in the study program "Energy Efficiency of Buildings" is performed in two shifts so a minimum area of 2m2 per student is provided.

Classes are held in the amphitheater, classrooms and specialized laboratories. The library has more than 100 library items that are relevant for the implementation of the study program "Energy Efficiency in Buildings". All courses are covered with appropriate reference textbook and teaching aids, which are available on time and in sufficient numbers for the normal teaching process. Also, an adequate informational support is provided.

The Faculty has a library and reading room and provides a place for every student in the amphitheater, classrooms and laboratories.

Study Programme Accreditation

SPECIALISED ACADEMIC STUDIES

Energy Efficiency in Buildings

Standard 11. Quality Control

Audit of the quality of the study program is conducted regularly and systematically through self-evaluation, external quality assurance and through decades long practice of students pooling.

Audit of the quality of the study program is achieved through:

- A survey of students at the end of the course.
- By the survey of graduates on the quality of the study program and logistical support to studies. In addition, the study assesses and comfort (clean and tidy classrooms, ...).
- The survey of teaching and non-teaching staff on the quality of the study program and logistical support to studies. This survey evaluates the Dean, student services, library and other departments of the Faculty.

Committee for the monitoring of the quality of the study program is composed of all the heads of departments that participate in the realization of the study program and two students from the study program
